HOARD'S DAIRYMAN:—Lack of a sufficient number of cows to justify the engagement of an experienced tester proved no setback to the organization of a cow testing association among the dairymen of Walla Walla County, Wn., who have had previous experience with such organizations and know something of the benefits to be derived from their operation. At the suggestion of A. W. Kasten, Smith-Hughes teacher of agriculture at the Walla Walla high school, two of his students in dairying were selected for the work of cow testing and signatures were secured to a contract which contemplates a maximum of 300 cows to be tested at a cost of $2 per cow.

The two boys, Virgil Russell and Howard Mann, sophomores at the high school, will work together on

Virgil Russell and Howard Mann, school students who keep the records of the cow testing association in Walla Walla County.

neighboring herds, a schedule being planned which will enable them to go out after school, make night and morning tests in two herds near Walla Walla, and return in time for their school duties next day. Week-ends and short vacations will be utilized for testing herds which are at a greater distance from the county seat, and during the summer vacation they will manage their schedule to suit themselves. They will receive some remuneration for their work, as well as school credit in their courses, and they expect the experience which they will secure to be of even greater value to them than their pay. County Agent W. H. Talley and leaders in the dairy project of the farm bureau cooperated to secure the signatures necessary to put the plan into effect.

This is the only association in the state using high school testers, though high school students in other places are doing some individual testing for dairymen. It is merely another indication of the growing demand for cow testing association work, 92 dairymen representing 1,800 cows having signed up for testing during the month of March. Thurston County, with 26 members and 360 cows, and Grays Harbor County, with 12 members and 268 cows, have united in one association, the tester to spend half of his time in each county. There is a second new association at work in the White River Valley, King County, and associations are being organized under the direction of F. W. Kehrli, extension dairy specialist of the state college, in Lewis, Clarke, and Cowlitz counties. Clallam County has formed an association since February 1, and most of the old ones have been reorganized for 1921.

G. N. ANGELL.

This map shows how the United States is divided into 12 Federal Land Bank Districts.

FARMERS!

This Is *Your* Banking System —Stand Behind It

THE FEDERAL FARM LOAN ACT created a farmers' national co-operative mortgage loan system, and the United States Supreme Court has fully sustained this Act of Congress. Now millions of dollars are needed to loan to farmers. Help the entire farming business by putting your money into this safe, tax-free investment.

5%
Tax-Exempt

Buy Federal Farm Loan Bonds

Denominations: $100, $500, $1000 and $5000

Federal Farm Loan Bonds are *safe*. They are secured by first mortgages on productive farms, the kind of assets with which you are already familiar. And in addition, they are guaranteed by all of the 12 Federal Land Banks with a combined capital of over $24,000,000.

Federal Farm Loan Bonds are *tax-free*. The principal is exempt; likewise the income from it.

Federal Farm Loan Bonds *yield 5%*—a better *net* income than from most farms rented to tenants.

Federal Farm Loan Bonds are *staple*. They bring a steady, dependable income twice a year; they are quickly convertible into cash; and they are A-1 security for bank loans to farmers, merchants, millers, livestock buyers and others.

Farmers who buy Federal Farm Loan Bonds help to build a farmers' national co-operative banking system—profits earned are paid to the farmer-borrowers who will eventually own all the stock of the Federal Land Banks.

The farm tenant who invests his surplus every year in Federal Farm Loan Bonds is accumulating capital with which to own his own farm. Farm boys and girls who buy small Federal Farm Loan Bonds are on their way to farm ownership. The farm hand who purchases Federal Farm Loan Bonds is forming habits of thrift and sound investment which lead toward the ownership of land.

Locate Your Federal Land Bank on the Map

Locate *your* Federal Land Bank on the map above. Write to it for free bulletin giving detailed information as to these bonds. Consult your county agent or secretary of your local national farm loan association. Stand back of the Federal Farm Loan System.

FEDERAL FARM LOAN BOARD

TREASURY DEPARTMENT WASHINGTON, D. C.

Junior Letters

Hoard's Dairyman Juniors:—Papa just got 15 registered Holsteins, 10 heifers and 5 bulls. We got some from Vermont, Illinois, and Michigan. We generally have registered Jerseys. In winter we feed our cows cactus. We take a pear burner to burn the thorns off and the cows go in back of us and eat cactus off the stalk. They grow seven or eight feet tall and they bloom and we make jelly and eat them raw with salt. When you go hunting you can hardly get through them. The cactus grows all over.

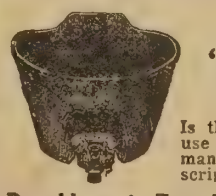
We have Saanen and Toggenburg goats which give milk. They had kids the first of April. We have about sixty chickens and get about thirty-six eggs a day. We have a big garden and have onions, potatoes, beets, carrots, beans, celery, parsley, and tomatoes. I will close now. If any juniors wish to write my address is 903 Westfall Ave., San Antonio, Texas. Victor Kahn.

Hoard's Dairyman Juniors:—I am fourteen years old and in the eighth grade. Our school house is a new building and consists of about 45 pupils.

We are milking about 43 cows and have 70 acres all seeded to alfalfa and barley. I like Holstein cows the best of all. We have two Jerseys and the rest are Holsteins. I have one grade calf and some Belgian hares and they grow fine.

I guess I have written enough for this is my first letter to the juniors. If any of the juniors wish to write to me my address is Nicolaus, Sutter Co., Calif. Rosa Fassler.

Duroc-Jerseys Are Prolific and Profitable



They raise *big* families. Hardy, easy-feeding, quick maturing. That is why Duroc-Jerseys today outnumber any other breed in the United States. Out of *all* the hogs marketed in 1918, 51 per cent were Durco-Jerseys.

WRITE FOR BOOKLET—"DUROC-JERSEY HOGS ARE PROFITABLE" published and mailed free by the largest swine record association in the world (over 10,000 members) for the benefit of hog raisers everywhere.

Married man wants work in dairy barn. Experienced with test cows. Prefer small herd and some field work. Address BOX 786, care Hoard's Dairyman.

Dairy Cattle Congress

The management of the Dairy Cattle Congress which will be held at Waterloo, Ia., September 26th to October 2nd, is receiving very encouraging replies from breeders of dairy cattle as a result of a preliminary announcement sent out recently. Indications are that more large herds from a distance will compete for honors in the ring this year than heretofore. If the present interest continues, 1920 showings of both Guernseys and Holsteins which were the largest ever made at the Congress, will be eclipsed. Prospects of a much larger showing of Jerseys, Ayrshires, and Brown Swiss are also bright.

The premium list which is now being assembled is larger and more attractive than that offered in 1920. The classifications are arranged to encourage the showing of young animals, thus helping the small breeder who is just starting his career as an exhibitor.—Publicity Manager, Dairy Cattle Congress.

New York Butter Market

(Continued from page 893)

the result undoubtedly of the increased freight rates which now obtain. Receivers hope that the reduction in wages paid railroad employees will result in a cutting of freight rates thereby allowing more of the butter to come this way. It is reported that greater quantities of butter than usual are being stored in Chicago this season, the buyers placing the butter there with the expectation that freight rates will be materially reduced before the time arrives for the butter to be consumed.

No foreign butter has been received of late in this market and it is highly improbable that any will be received during the coming year. The so-called Emergency Tariff Bill became a law last week when signed by the president and a duty of 6c per pound is now operative for butter. Some Argentine butter is still being held by receivers but there is little likelihood that it will move in the near future. As receivers took that butter to account at a price of about 50c, they stand to lose large sums of money on their present holdings of it.

On Tuesday of last week, extras were quoted at 29c. Values remained unchanged until Friday when the price advanced ½c. That was followed by excessive advances of ½c, 1c, and 1c on Saturday, Monday, and Tuesday respectively. At the close today quotations are as follows: Extras (92 score), 31½@32c; higher scoring than extras (93 score or higher), 32½@33c; firsts (90—91 score), 30@31c; firsts (88@89 score), 28@29½c; and seconds (83—87 score), 24@27c. W. B. Liverance.

Missouri Holstein Show and Sale

The Missouri Holstein Breeders' Association held a very successful show in connection with their annual state sale on May 23rd and 24th at Sedalia. Holstein breeders entered 125 animals in the open classes with 95 of the entries females.

The exhibitors included Pickering Farm, C. M. Long, Pettis County Holstein-Friesian Company, Sherman & Hill, T. S. Weathers, E. P. Finck, C. E. Driver, John F. Bluhm, Oliver Calvert, J. L. Ferguson, Wm. Monsees & Son, S. W. Cooke & Son, Fredmar Farms, C. G. Gist, Glenn G. Davis, Geo. Georges, and E. K. Magee.

W. W. Swett from the University of Missouri did the judging.

In the aged cow class, with 24 entries, Georges took 1st and 3rd on Empress Beets Spofford and Hazel Beets Spofford; 2, Finck, on Last Chance Zwinger; 4, Cooke & Sons on Beachwood Gerben Segis; 5, Long on Carlotta Butter Gerben.

Three-year-olds (9 shown)—1 and 2, Pickering on Katy Posch Florence DeKol and Pauline Tidy Posch; 3, Cooke & Sons on Freda Pontiac Segis; 4, Davis on Snowflake Hurmora; 5, Gist on Anglum Mercedes Korndyke.

Two-year-olds (17 shown)—1, Cooke & Sons on Segis Hillcrest Josephine; 2 and 5, Pickering on Queen Finderne and Prilley Walker Genesta; 3 and 4, Davis on Gwendolyn Josephine and Korndyke Springvale Hazel.

Senior yearlings (15 shown)—1, Pickering on Miss Perfection Jennie; 2, Cooke & Sons on Kitty Segis Walker Korndyke; 3, Georges on Irene Pontiac Beets De Kol; 4, Davis on Mary Josephine Korndyke; 5, Finck on Purity Hengerveld Korndyke.

Junior yearlings (14 shown)—1, Finck on Purity Maggie King Segis De Kol; 2, 4, and 5, Pickering on Aaggie Princess Segis, Pickering Maud Lady Korndyke, and Gertrude Reliance Butter Girl; 3, Davis on Hazel Hallwood Korndyke.

Senior calves (14 shown)—1, 2, and 3, Davis on Helen Beechwood Korndyke, Thodosia Hallwood Korndyke, and Alice Hallwood Korndyke; 4, Pettis County Holstein-Friesian Company, on Sedalia Pontiac Johanna; 5, Driver on Lewismonte Alban Korndyke De Kol.

Junior calves (2 shown)—1 and 2, Pickering on unnamed and unnamed.

Senior champion—Georges on Empress Beets Spofford.

Junior and Grand Champion—Davis on Helen Hallwood Korndyke.

Aged bulls (1 shown)—Davis on Sir Korndyke Hengerveld De Kol Jr.

Two-year-olds (2 shown)—1, Davis on Hallwood Korndyke; 2, Fredmar on Carnation Denver Segis.

Bulls one year and under two years (10 shown)—1, Weathers on Inter County Chief Josephine; 2, Pettis County Holstein-Friesian Co. on Pontiac Johanna Beechwood; 3, Finck on Campus Sir Korndyke Gabul; 4, Davis on Only Hilary Korndyke; 5, Pickering on Pickering Cornelius Korndyke.

Senior calves (15 shown)—1, Davis on Swastika; 2 and 5, Pickering on Pickering McKinley Hengerveld and Pickering Finderne Videmus Spring; 3, Weathers on Inter County Sir Josephine; 4, Fredmar on Sir Fredmar Ormsby Ragapple.

Junior calves (2 shown)—1, Pickering on Pickering Finderne Pohlcrest Joe; 2, Schermes & Hill on Prince Segis Korndyke Sadie Vale.

Senior and Grand Champion—Davis on Hallwood Korndyke.

Junior champion:—Weathers on Inter County Chief Josephine.

Exhibitor's herd (1 shown)—Davis. Breeders' young herd (3 shown)—1, Davis; 2, Pickering. Calf herd (1 shown)—Davis. Get of sire (6 shown)—2, Weathers. Produce of dam (6 shown)—1, Davis, 2, Weathers.

Following the show, on May 24th, 90 head including part of those animals in the show, were sold at the annual Missouri state sale. Pickering Farm topped the sale with a three-year-old daughter of Finderne Pride Johanna Korndyke at $835. A telegram received by Major Harlo J. Fiske, manager of Pickering Farm, at the sale, from Palo Alta Farms, California, stated that a daughter of this same sire had just completed a 7-day record of 34.8 lbs. butter and 747 lbs. milk which of course added to the value of the heifer herself.

The entire Pickering Farm consignment averaged $325 for everything over a year old. The average for the entire sale for everything a year old or over was $288.

DON'T KEEP BOARDER COWS

Every dairy man needs this outfit. Points out the "boarder cow". Enables him to buy cows with his eyes open and to check up his creamery, etc. Tells him how to regulate feed to increase production. Highly recommended by U. S. Department of Agriculture, County Agents, etc.
Free with each testing machine: 4 test bottles, 1 acid measure, 1 pipette, 2 brushes, 1 bottle acid and Instruction Sheet giving complete information about testing milk and cream.

Three Registered
Holstein Bulls

No. 1 **Our Herd Bull Columbo Hilldale Pontiac.** Good breeder and strong A. R. O. backing, five years old.
No. 2 **Oasis King Pontiac,** ready for service.
No. 3 **Omer Pietertje Pontiac,** calved Nov. 18, 1920.

These are all fine individuals with splendid milk and butter producing records and priced so that anyone who may have use can own a Herd Header at a reasonable cost. Prices and pedigrees furnished to anyone who is interested. Springs Stock Farm, five miles west of Royal Center, Indiana. S. O. Spring, First Nat'l Bank Bldg., Chicago, Ill.

Primrose Prices Down!

Go over these Primrose details again
—then see the International dealer

PRIMROSE is the only cream separator with two wide-open cream outlets that are never restricted in size. The regulating screw is in the skimmilk outlet. It is easy to adjust because it works on the large volume of skimmilk instead of on the small volume of cream.

In the Primrose, oil is forced through the bearings and not just to them.

It is the only separator in which the dirty used oil is turned out automatically when new oil is poured in.

Primrose separators run easily and steadily, skim with exceeding closeness, and serve their owners reliably for many years. Direct power drive and electric motor drive equipment available. Built in four sizes with capacities ranging from 350 to 850 pounds of milk per hour.

Primrose quality may now be had at lowered prices. Take advantage of Primrose lower price at the stores of the International dealers.

Barron Co. Holstein Breeders' "Quality Sale"
To Be Held At
Chetek, Wis., Wednesday, June 22

45 HEAD — Personally Inspected and of the Quality to make a Worth While Sale

Barron County Bankers Will Extend One Year's Credit to Buyers Entitled to Same, Providing Arrangements Are Made Before the Sale.

Barron County is in a Class By Itself, in that it is a Federally Tested County. In addition all animals in the sale will be sold under the usual 60-day guarantee.

THERE WILL BE SOME REAL DAIRY COWS—

A 24.67-lb. daughter of Canary Paul Pearl of the Dairy, also a 16.97-lb. daughter of the same bull.
A number of good daughters of Sir Johanna Piebe.
Cows bred to Heuwtje Vale Pontiac who is from a 21-lb. 2-year-old dam; King Segis Pontiac Major, a son of King Segis Pontiac and from a 21-lb. 2-year-old; Sterling Jewel Paul, a 25-lb. bull whose dam has 879 lbs. for the year with over 20,000 lbs. milk.
A nice bunch of young cows in calf to King Pontiac Calypse Valdessa, and all due right around sale time.

A FEW RIGHT GOOD SIRES—

Yearling sired by Sir Johanna Piebe and from a 776.85-lb. 3-year-old.
A 1½-year-old sired by the well known bull, Sir Ormsby Haidee Pietertje, and from a 17-lb. 3-year-old dam (also in the sale).
A 3-year-old son of King Superba, also a 25.91-lb calf sired by King Ormsby Col. Banostine.
A son of Willow Ridge Pietertje Ormsby and from a 27-lb. dam.

Remember the date—June 22. And the place—Chetek.
AUCTIONEERS—Haeger, assisted by local talent.

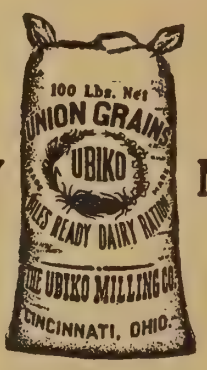
Vermont Co-operatives Federate

(Continued from page 881)

half of March was $.58 for fat and 50 cents for skimmilk, with deductions for hauling. The average price paid for fat in 1920 was 71.4 cents, for skimmilk 91 cents. The milk is graded on the basis of acidity, upon receipt, into No. 1 and No. 2. In the month only two members sold milk which was given the lower grade. In 1919 the price to the producer was 91.03 per cent of the creamery selling price; in 1920, the expense was slightly less, 91.19 cents out of each dollar going back to the producer.

Two other creamery members of the federation made even a better accounting to the patrons. On a $300,000 business at Shelburne, 93.7 per cent went back to the producer and at Grand Isle, where a $150,000 business was conducted last year, 92 per cent was net to the farmer.



In 1920 the Richmond creamery took in 12,211,198 lbs. of 3.94 per cent milk, 12,034,527 lbs. of which was sweet. It received 128,639 lbs. of cream, 105,725 lbs. being received sweet. There were sold in milk and cream, 396,469 lbs. fat; in butter, 83,065 lbs.; in cheese, 37,562 lbs.; and in condensed milk, 945 lbs. Of the 10,379,518 lbs. of skimmilk received, 8,162,434 lbs. were sold as milk; 2,032,683 lbs. were manufactured; and 182,292 lbs. were returned to farmers.

The Richmond creamery clearly indicates the benefits to be derived from being equipped to supply a variety of markets. The co-operative idea is successfully demonstrated there in a single unit. What the federation does is to unite a number of such units for mutual protection and benefit. Its purpose is to have a central purchasing force which will save a great deal in increased efficiency in buying; to employ an expert accountant who will show just where profits are made and where money is lost in each creamery; and to sell through a common sales agency which will be informed on markets.

As yet, the federation plan has been slow in getting under way. Co-operation grows slowly. Even now the officers and the individual members have not fully grasped the possibilities of such an organization when it is perfected. It has been hindered in its progress by men who believe it will invade their markets—men who appreciate the justice of the desire of producers to market their own product but who fear the strength of such a federation. That there is ample proof that their fears have little foundation is indicated by the statement of F. H. Edwards that the co-operative creameries of Vermont have been the means of advancing the price of milk in conjunction with the Dairymen's League and the New England Milk Producers' Association from 10 to 15c per hundred lbs. The Federation's present officers are: John McGrath, Milton Creamery, president; Geo. Dunsmore, St. Albans Creamery, secretary; Carl Fletcher, Shelburne, treasurer; and F. H. Edwards, Richmond, manager. Mr. Edwards is giving excellent service as a sales agent and has kept markets open for the creameries' output. Several creameries have adopted a common accounting system, and some equipment has been purchased for the member creameries by Mr. Edwards, but the plan as originally conceived is not yet in full swing. Upon these men rests the responsibility of working out in detail the most complete co-operative effort yet employed in the marketing of dairy products. Through this plan may be realized the independence the producer has so long sought.

The federation plan is proved a success, even when in operation on a small scale. There is need for this co-operative movement; the spirit of co-operation is in the hearts of Vermont dairymen; the economics of the system are sound. When the idea is fully worked out these creameries will trade-mark their product and will sell an output of uniform high quality. That requires educational work on the farms and in the factories. Then a time may come when the entire product of the federation will be pooled, each member creamery manufacturing the article which the federation directs and each taking its proportion of the returns as the entire output of the federation is marketed. In this creamery federation Vermont is demonstrating the fundamentals of economic co-operative effort. The lesson it teaches is of great value to every community where dairying is an important industry.

VETERINARY

Advice is given free in this department. Inquires must be signed by the writer, and should pertain to veterinary Matters only. Where an immediate reply and prescription are desired by mail, the inquiry must be accompanied by a fee of one dollar. In every instance it will be necessary to give a full description of the symptoms present.

Bloat in Cattle

The term "bloat" is applied to abnormal distension of the paunch with gas resulting from fermentation of feed. The condition is characterized by a drumlike swelling high up in the left flank which may even be raised above the level of the backbone. The affected animal stops eating and ruminating, stands with elbows turned outward, breathes with difficulty, and gasps for air when suffocation threatens.

It is the general experience that large quantities of wet, green, immature clover, alfalfa, rye, peas and oats, rape, or other soiling or grazing crops suddenly eaten by an animal not accustomed to such feed are the commonest cause of bloat. It may, however, be induced by a sudden change of feed or by giving feed that has become moldy or heated. We have observed that attacks are particularly liable to occur in hot, muggy weather when thunderstorms occur so that cows had better be kept out of lush pastures during such weather. It is also well to feed hay before turning cattle into clover or alfalfa pasture the first time; to leave them on it for only a short time at first and then gradually increase the time. Hungry cattle just off the cars or those that have been driven far should never be immediately turned into rank, green growth, especially when the crop is wet with rain or dew. Allowing grazing cattle free access to a mixture of 1 part of slaked lime and 2 or 3 parts of salt tends to prevent bloating. Alfalfa in full bloom rarely if ever causes bloat, but the sugar of clover blossoms is said to be a fertile cause.

Tapping the paunch with a trocar and canula to draw off the gas need not be done in all cases. In our opinion it should only be resorted to when the animal is in immediate danger of suffocation as indicated by thrusting out of the tongue and gasping for air. In less dangerous stages of bloat simpler treatment will prevent suffocation as, for instance, typing a rope or round stick bitwise in the mouth, standing the hind quarters of the animal downhill, dashing cold water on the body, running the cow into cold water or passing an oiled rubber tube or probang down the gullet.

Medicinal treatment consists in administering 2 ounces each of pure turpentine and aromatic spirits of ammonia in a quart of new milk, or 2 to 4 teaspoonfuls of formaldehyde, or 1 teaspoonful of permanganate of potash in a quart of water. Some veterinarians give even larger doses of these drugs and there are many favorite home remedies, all more or less helpful, which need not be mentioned here. "Drenching" with liquid medicine from a bottle should be very slowly and carefully done.

When "tapping" is necessary, it should be done as follows: Clip off a patch of hair and cleanse and disinfect the skin (if time allow) at a point in the triangle near the last rib, transverse processes of the spine and point of the hip, high up in the most distended part of the left flank. Then cut a small slit in the skin and standing on the right or milking side of the cow, reach over, insert the point of the sterilized trocar (dagger) and canula (tube) in the slit and drive them in the full length, aiming in the direction of the right forefoot. Now withdraw the trocar, and when the gas has escaped, return it to the canula, pull both out together, cleanse and pinch the wound shut, and paint it with tincture of iodin or dust it with iodoform. Pine tar will do fairly well if disinfectants are not available.

Obstructed Teat

I have a heifer that freshened about a week ago. She has one quarter extra hard to milk. I have been running a quill up into it but that doesn't give any permanent relief. She is going to be a kicker unless I can stop this practice. There is a sort of a lump at at the end of the teat. Please tell me how I can open the hole and get the milk easily.

Ronneby, Minn. C. C. B.

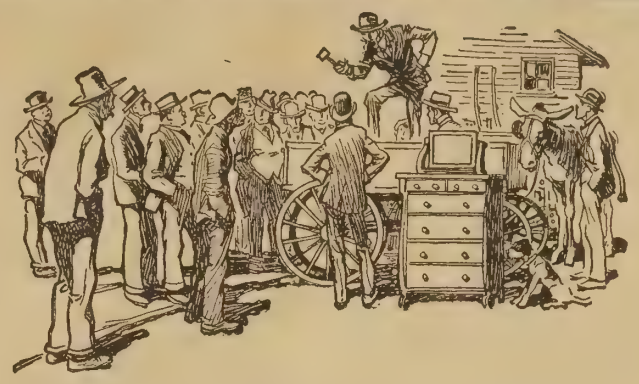
Continued use of the quill will be about certain to cause ruinous garget. A veterinarian should be employed to cut down through the obstruction in four different directions by means of a teat bistoury. If you cannot have that done, a sterilized teat plug should be inserted in the cut between milkings.

Lice

I would like to know what is good for lice on calves and cows.

Rossville, Md. H. S. M.

If you do not object to causing a messy condition of the coat, simply groom the infested parts with a brush dipped in raw linseed oil and repeat the application when seen to be necessary. The entire body should not, however, be treated at one time. A solution of coal-tar dip made and used according to directions given by the manufacturer would also prove effective, or use a tea made by boiling four ounces of stavesacre or larkspur seeds for thirty minutes in water.



Boys' and girls' clubs of today are going to mean much to the agriculture of tomorrow. Are you helping in your community?

Lowe Brothers

Which Brings Most at Auction?

Which would you all buy right now. A wagon with the paint all off, or one that has been kept painted? Would you pay all those dollars more for it, just because it *looks* better? Or because it *is* better?

Because it *is*, of course! It *is* better, because old-tear-to-pieces-weather can't get his finger at it. If you'd pay more for a painted wagon, seeder, cultivator or plow, then why don't you paint all yours up?

You may not want to sell them, but it will keep you a lot longer from having to buy new ones. We make a special paint just for the purpose. It's so good, it's used on the best of trucks and tractors. So that's why we started calling it, Truck and Tractor Paint. Next time you are in town trading, just ask about it.

The Two Biggest Dairy States

Reports of the 14th census are slowly becoming available, the two most recent being summaries for the states of New York and Wisconsin. For the first time the census discriminates between beef cows and dairy cows. As these two are considered close rivals, the following statistical data may be of interest:

	New York	Wisconsin
Horses and mules	543,494	687,648
Beef Cattle	63,170	287,346
Total dairy cattle	2,081,074	2,763,483
Dairy calves	291,721	503,256
Dairy heifers	248,164	384,695
Dairy cows	1,481,918	1,795,122
Dairy bulls	59,271	80,410
Sheep	578,726	479,991
Swine	600,560	1,596,419
Milk (lbs.)	6,502,034,101	7,381,023,281
Land in farms (A.)	20,632,803	22,148,223
Improved acres	13,158,781	12,452,216
Number of farms	193,195	189,295

Pure-breds in Colorado

For the first time the U. S. census gives figures on the number of pure-breds for the various breeds of farm animals. The first report to reach our desk covers the State of Colorado, which is credited with 114 Ayrshires, 241 Guernseys, 4,057 Holsteins, 1,605 Jerseys, and 431 other dairy breeds. Of these pure-bred animals, 1,799 are males and 4,649 are females.

BROWN SWISS

BETTY OF LAKE VIEW

Breed Brown Swiss Cattle

They prove their superiority over other breeds when subjected to trying conditions on the farm, by keeping in good flesh and filling the pail while other cows grow thin and reduce their yield. You can prove this to your satisfaction.

MIDDLESEX MEADOWS FARM

OFFERS

Two outstanding AYRSHIRE BULL CALVES for sale for immediate shipment

No. 1—MIDDLESEX WHITE CHANCELLOR 25273, born September 17th, 1920.
Sire—Cavalier's Netherall Chancellor 21216, who sired the winning bull calf at this year's National Dairy Show.
Dam—White Heather of Highland 42752, who stood 2nd in the aged cow class at the same show (this year's National) and who has two good Roll of Honor records.

No. 2—MIDDLESEX MANCHESTER, born March 10th, 1921.
Sire—Auchenbrain Toreador (Imp.) 24761, record priced bull of the breed and Grand Champion at Maryland, New York, Connecticut, and New Jersey State Fairs this year.
Dam—Bida Clinton 31489, who has three A. R. records that average 11,000 lbs. of milk, 453 lbs. of fat, 4.17%; and whose two-year-old daughters will have records of over 10,000 lbs. of better than 4.00%.

Both bulls have excellent individuality, and are fit to go into any show ring and hold their own. They should develop into extra good herd sires. Prices reasonable—we KNOW you can't get as good as these two for any less money elsewhere.

A. Henry Higginson (Owner). W. R. COUTTS, (Supt.)
South Lincoln, Massachusetts

Monstone Farm Ayrshires

DISPERSAL SALE — Locust View Farm Guernseys

35 Head Registered Guernseys, July 1, 1921

The twenty head offered by Locust View Farm successfully passed the second annual tuberculin test May 4, 1921, making the Locust View herd one of the very few accredited herds of Guernseys in the state. We have not gone in for Advanced Registry work but our stock is the kind that will make good if given a chance. I am a breeder and not a dealer and have bred every animal in my offering.

CONSIGNMENTS—R. S. Eyster and J. L. Engle of Beloit, O., will consign fifteen head to this sale. They are of Sequel breeding, which is a good producing strain. Locust View Farm is located 2½ miles north of Garfield, O., which is on the main line of the P. F. W. and C. R. R., also on the Stark Electric line running from Canton to Salem, O., trains and electric cars will be met to convey visitors to farm on morning of sale.

Send for Sale Catalog to E. G. Engle, North Benton, Ohio.

F. W. Andrews & Son, Auctioneers. H. C. McCamon, Sales Manager.
A. L. Atkinson, Clerk, Alliance, Ohio

Surplus Plant at Capital

(Continued from page 880)

notes of the newly-chartered Maryland corporation, the issue bearing 6 per cent interest and the note is payable in full in five yearly installments. Therefore, the dairyman is in reality only loaning his money to the Maryland and Virginia Dairymen's Co-operative Association with assurance of reimbursement of the principal plus interest. Funds with which to pay the 6 per cent interest on these certificates will be raised from month to month by assessing a levy on all milk marketed in the District of Columbia. A levy of one cent on the gallon will be adequate to this requirement, once the plant is in operation.

A central laboratory for testing milk of the membership of the organization is to be an additional virtue of the milk-utilization factory. The weight or measure of the milk sold will be accurately checked, the patron will be issued an official certificate of the butterfat contained in the fluid marketed, and an inspection service of milk or cream alleged to be sour will be rendered. It is in the continuity of the market that primary benefit of the plant is realized by dairymen. To illustrate, if the name of a producer is dropped from the purchasing list of the distributor through no fault of the dairyman, and the quality of his milk is intact, the association pays the market price for the fluid consigned to the utilization factory. The loss incurred, if any, is equally shared by the organization membership without deprivation, individually or collectively.

In endorsing the establishment of the first central station to be authorized in Washington, Dr. Harvey W. Wiley said: "Let us now ask what does the dairyman give for all the benefits received? First, he lends eight dollars for each cow which he milks. Second, he offers, temporarily, at least, the income of that eight dollars and forty-eight cents for each cow. Third, he gives a small fraction of the milk which he sends in for the general use of the association, himself included. The subscriber knows that the money he gives is handled by his own association, by the men he has chosen and in whom he has entire confidence. He also realizes that this is the beginning of real independence. It is a move which eventually will bring the milk producer into closer contact with the consumer."

Pine City Creamery Reports 1920 Results

In 1920 the Pine City Co-operative Creamery of Minnesota handled 386,252.7 lbs. of butterfat. Of this 207,158.4 lbs. were purchased in milk, 134,734.3 lbs. in second grade cream, and 44,360 lbs. in second grade cream. The average price paid for butterfat in milk was 69.2 cents per pound, for that in sweet cream 67.33 cents, and for second grade cream fat, 62.33 cents.

The butter manufactured sold for $119,544.35. Sales of buttermilk totaled, $80.73; of cream, $14,604.58; and of milk, $171,991.10, the total income of the creamery for the year being $319,715.96.

S. A. Striegl is secretary, Paul Dorrow, vice-president, and L. Lohnbakken, operator.

A Few Exceptional Individuals Ready for Service

Write for Bull Sale List LISLE FARMS CO., LISLE, ILL.

Sir Pietertje Ormsby Mercedes 41st

is proving to be one of the very best sons of S. P. O. M. His sons and daughters have wonderfully good type. His daughters are making remarkably good 7-day and long time records.

We Have a Few Sons For Sale

from dams with mighty good records. A few are just about ready for service. One of them will suit you.

Write us for complete information.

Gustave Pabst's Hollyhock Farms

Fred J. Southcott, Manager Dousman, Wisconsin

You Certainly Understand —

what old Sir Piet and his many world's record breaking daughters have meant and still mean to the dairy industry, therefore it is not hard for any dairyman to realize what a son of

King Colantha Pietertje Ormsby (182736)

will do to his herd because, King is the

Only Bull in the World

combining in closest possible degree Sir Piet's two greatest real long distance daughters.
His dam, Colantha Pietertje Lass has three yearly record averages close to 1,100 lbs. butter her best yearly record is 1,265.75.
His two nearest dams have nine yearly record averages better than 1,000 lbs. Their best yearly average better than 1,200 lbs. butter.
His dam and sire were both 1st prize winners at several state fairs.
Come and see our bred-for-production Holsteins, the kind you can buy and sell at a profit.

PEE-CEE-BEE STOCK FARM, Beck & Peterson, Racine, Wis.

Yearly Records

Choice Young Bulls

from one to fourteen months old for sale. Sired by Cloverlawn Johanna Piebe whose five nearest dams average 1,070 lbs. of butter, 23,809 lbs. of milk a year. Herd numbers 140 head, forty cows with yearly records. State exactly what you want.

JOHN PULS. - HARTFORD, WISCONSIN

HOLSTEIN COWS

We offer for sale a number of cows, heifers, bulls and calves of all ages. Some sired by King Korndyke Veeman whose two nearest dams average over

WISCONSIN STAR STOCK FARM,

HEIFERS and BULLS

37 lbs. butter in 7 days and bred to King Sadie Vale Walker who is a son of the youngest 29-lb. cow in the world. Come and see them or write to

Reasonable terms.

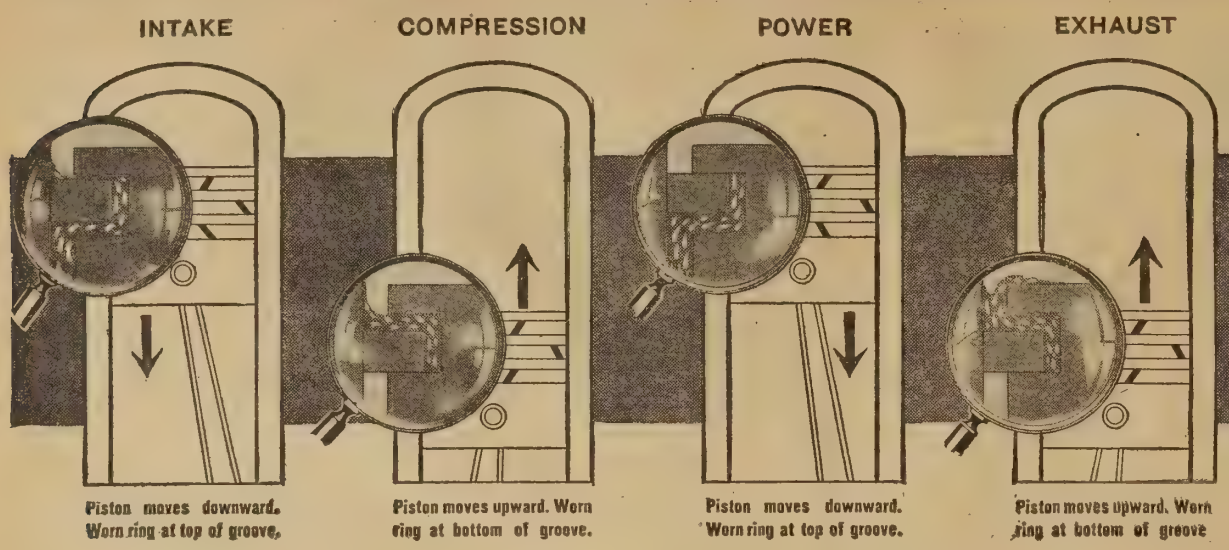
W. B. BARNEY & SONS Chapin, Iowa

Ready For Service

GOOD INDIVIDUAL



His dam is just finishing a record of over 700 lbs. butter from over 17,500 lbs. milk at 2 years, 6 months. His dam's dam made 1,117 lbs. butter from 24,648 lbs. milk as a junior 4-year-old. At 7 years she made 34 lbs. butter from 742 lbs. milk in 7 days and 1,030 lbs. butter from 24,000 lbs. milk in 305 days.

Sire's dam made 27.86 lbs. butter from 658 lbs. milk in 7 days; 705.9 lbs. butter from 16,820 lbs. milk in 272 days, carrying calf 215 days.

He is a double grandson of SIR JOHANNA FAYNE, who now has 25 daughters averaging over 20,000 lbs. milk in a year, 15 of them in heifer form.

Write for pedigree, photo and price

IOWANA FARMS, (Herd Under Federal Supervision) Davenport, Iowa

NO

Heavier Oil can never replace metal worn away

YOU are sometimes advised: "As your automobile engine becomes worn use a heavier oil." Heavier oil, some people will tell you, provides a better seal for clearances enlarged through wear.

But first consider these facts:

As your car grows older, metal is worn away by the wear between moving surfaces. Will heavier oil replace this lost metal? NO.

The oiling system of your engine was designed specifically to circulate lubricating oil of a certain body. Will this oiling system—pump, screen, oil pipes, etc.—distribute as effectively a heavier oil? NO.

Any oil, whether heavy or light, when used in worn engines will work past the pistons and piston rings and enter the combustion chambers, forming carbon. The heavier the oil, the more aggravated will usually be the carbon deposit.

What are the wise and only proper measures to take when your engine is badly worn? Obviously, have the bearings adjusted, have new pistons and piston rings fitted, and *continue to use the correct grade of oil for which your engine and oiling system were designed.*

WORN RINGS
cause Carbon Deposits

Worn piston rings move perceptibly upward on the down stroke of the piston; the oil accumulates under and behind the rings. Then as the piston moves upward the rings move to the bottom of the recess, forcing the oil by the rings. This is sometimes termed "oil pumping." The oil ultimately reaches the combustion chamber causing carbon deposit.

This whole subject of engine wear and heavier oils is dealt with in our folder, "Lubrication—Its Relation to Engine Wear." Rather than invite additional repairs and trouble through the use of too heavy oil, it will pay you to write to our nearest Branch for a copy of this paper.

* * *

THE CORRECT OIL for your car—during its entire life—is specified by the Gargoyle Mobiloils Chart of Recommendations.

If your car is not listed in the partial Chart shown here, consult the complete Chart at your dealer's, or send for booklet, "Correct Lubrication," which lists the correct grades of Gargoyle Mobiloils for all automobiles, tractors and motorcycles.

Mobiloils

A grade for each type of motor

Chart of Recommendations

(Abbreviated Edition)

How to Read the Chart:

THE correct grades of Gargoyle Mobiloils for engine lubrication of both passenger and commercial cars are specified in the Chart below.

A means Gargoyle Mobiloil "A"
B means Gargoyle Mobiloil "B"
E means Gargoyle Mobiloil "E"
Arc means Gargoyle Mobiloil Arctic

Where different grades are recommended for summer and winter use, the winter recommendations should be followed during the entire period when freezing temperatures may be experienced.

The recommendations for prominent makes of engines used in many cars are listed separately for convenience.

The Chart of Recommendations is compiled by the Vacuum Oil Company's Board of Automotive Engineers, and represents our professional advice on correct automobile lubrication.

A WEEKLY JOURNAL DEVOTED TO DAIRY FARMING

Fort Atkinson, Wisconsin Volume LXI, No. 23 June 24, 1921

Cream Calves and Pigs

A Missouri Farmer writes:

"I bought a De Laval Separator and in 12 months I sold $400 worth of cream, and received $150 for calves and $270 for pigs which I raised on the skim-milk. I can truthfully say the De Laval Separator is the most profitable investment I have made for some time."

This is not an unusual instance of what a De Laval Separator will do, and thousands of farmers have done even better.

The De Laval Separator saves the most cream and gives you the greatest cash income. It provides skim-milk in the best condition for feeding calves, pigs and poultry. And it gives this excellent service over the longest period of time. That's why there are more than 2,500,000 in use the world over. It is the best and in the long run the cheapest.

Easy terms can be arranged so that it will pay for itself. See your De Laval agent or write us.

WORKING COWS IN WESTERN WASHINGTON

J. B. BAIN, District of Columbia

YES, they "sure do" work cows in Western Washington. They work them in summer, they ork them in winter, and all through year. But then, a well bred cow es to work and give milk when she obtain the feeds she likes and ich at the same time have the milk-ducing nutrients in them.

A bulletin published recently by Bureau of Animal Industry of the ited States Department of Agri-lture gives the results of a two-ar study of the requirements for oducing milk in a dairy section out 70 miles north of Seattle. Ac-rding to this bulletin Western ashington is a real cow country nen it comes to producing large antities of milk.

In past ages the lowland parts of is section were covered by the sea, t the water has gradually receded d dikes have been constructed to ep back the water. The fertile soil well adapted for farming, and the imate is ideal for producing an undant pasturage during many onths of the year.

Most of the cattle in this section e Holsteins, and as they graze rough the rich pastures the sight of em together with the dikes and nu-erous windmills dotting the land-ape recalls to the observer the de-riptions of this breed in its native untry.

What is in 100 Pounds of Milk?

The object of the study was to find t what was required to produce 100 s. of milk. In August, 1917, the epartment sent a representative to Western Washington to determine hrough a study of the dairy farms he amount of feed and labor required nd other expenses incurred in the roduction of milk. The representa-ve began visiting as many dairymen s he could in a month, spending a hole day at each place. While he as on a farm he observed the quan-ity of feed fed, as well as the num-er of hours of labor required to feed nd milk the herd, and to care for the ilk. During the first year, the field an visited 17 farms regularly and uring the second year 18 farms re-eived monthly visits from him.

The average cow in the local ow testing association produced ,833 lbs. of milk in a year, or just 67 lbs. less than 4 tons. It required 9.4 lbs. of grain to produce 100 lbs. f milk in winter. The cows also eceived 92.9 lbs. of hay or other dry oughage, and 143.3 lbs. of succulent eed for 100 lbs. of milk produced in vinter.

For several months of the second ummer some of the herds were al-owed to graze in meadows where the lover or velvet grass stood a foot high —a stand large enough to be cut for ay. Timothy and clover grow very ank due to the fertile soil, cool veather, and abundance of moisture.

It is the custom to allow the cows to graze over the meadows from one to three weeks in the spring since this method supplies good feed for the cows until the permanent pastures have obtained a start. This practice also benefits the hay crop, for cropping it back produces a hay which is not so coarse. During the summer, therefore, the cows received in addition to the 5.2 lbs. of grain, only 7.5 lbs. of dry roughage and 40.4 lbs. of succulent feed for 100 lbs. of milk.

HOME OF A SKAGIT COUNTY HERD

One man milking a string of twenty-five cows of necessity spends a great deal of his time in this barn. Plenty of sunlight and fresh air help the milker as well as the cows.

The Herdsman Knows Cows

These Western Washington dairymen know that a herdsman who is a good feeder and milker is the first essential for producing large quantities of milk at low cost, and from $75 to $125 a month with board included is often paid to such men. Many of the larger dairies are handled by men who follow milking as a trade. Most of these men are Scandinavian or Swiss descent. They surely do like cows and know how to handle, feed, and milk them.

The Chimes of the Swiss Milkers

Many of the Swiss milkers have their set of Swiss chiming bells which they carry with them wherever they go, just as a teamster carries with him his strings of ivory rings and other trappings to put on the horses he drives. The chiming bells vary considerably both in size and weight. It takes some time for a cow to become accustomed to carrying a large bell. In the spring, when the cows go out to pasture, the Swiss milker puts the smallest bell on the cow which he selects to carry the largest bell during the season. In a few days when she has become accustomed to carrying that bell, he removes it and puts a slightly heavier bell in its place. He then puts the smallest bell on another cow. In a few days he puts a slightly heavier bell on the first cow and places the bell she wore on the second cow and gives the smallest bell to a third cow. In this manner the cows become accustomed to carrying the heavier bells. When the Swiss herdsman can hear the soft, sweet music of his native home as it comes floating back on the cool, summer night air from the cows as they graze through the green pastures—then he is happy.

THE SIGN OF THE SILO IN WESTERN WASHINGTON

Succulent roughage is indicative of profitable dairying. Oats, wheat, vetch, and clover grow in profusion on the fertile flats of this "cow country" and make excellent silage.

What is a String of Cows?

The cows are handled on the "string" plan whereby each man has a certain number of cows in his string which he feeds, milks, and cares for entirely. During the first year each man handling a string had 32.8 cows in his string, while there were 28.8 cows in the average string during the second year. These professional milkers do no other work around the farm but give their entire time to the dairy, for it takes time to milk the string of 28 to 32 cows. The men are very proficient milkers and excellent dairymen. They have learned that the dairy cow is a creature of habit and recognize the value of following regular schedules for doing their work. At one farm the fieldman stated that a person could have set his watch quite accurately by noting which cow the herdsman was milking, so closely did the herdsman keep to the regular schedule. At two of the farms the men were at the barn and ready to milk at 2 o'clock in the morning. On other farms from 2:30 to 4 o'clock were the hours in vogue for starting the day's work. Yes, these men can milk cows. No one denies that fact after seeing them milk. Milkers have been known to milk a double string regularly and the owner paid them two men's wages for doing it. Another instance is known where one man milked 42 cows twice daily for a month, while another man, for more than a week, milked 22 10-gallon cans full a day.

It is a "Wet" Country

I have intimated that this section is a "wet" country during certain months of the year. It is so "wet" that even the cows get "full", but it is a milk jag. In summer a herdsman milks from 10 to 14 10-gallon cans of milk from a string. In winter a string produces from 6 to 10 cans of milk.

In winter it required 1.9 hours of human labor and .01 hour of horse labor to produce 100 lbs. of milk, while in summer 1.3 hours of human labor and .015 hour of horse labor were required. The cost of hauling and grinding concentrates amounted to $0.022 in winter and $0.003 in summer for each 100 lbs. of milk. In summer it required 0.025 of an acre for pasture and 0.1 of a pound of straw for bedding to produce 100 lbs. of milk, while in winter 9 lbs. of bed-

(Continued on page 925)

AMERICAN FARM BUREAU NOTES

THE American Farm Bureau Federation has more than a million members and is growing at the rate of 50,000 members a month. In the last six months 307,713 new soldiers of the soil have been recruited in the Farm Bureau army. At the permanent organization meeting of the American Farm Bureau Federation in Chicago on March 4, 1920, 28 states affiliated themselves with the national organization; 15 states have joined up since then. The steady growth of the organization is shown as follows: March 4, 1920, 456,000; Dec. 1, 1920, 744,401; June 1, 1921, 1,052,114.

Explaining the work of the Department of Organization, of which he is director, Secretary Coverdale says:

"Nearly all the organization work is being done by the states themselves. The American Farm Bureau Federation has recommended a few organization men to states asking for assistance.

"We find that the farmer is hopeful in spite of the deflation to which he has been subjected. He has full faith in the Farm Bureau because it is his own organization. He is joining as readily now as in the days of better prices. He tells us that he is convinced that the American Farm Bureau Federation will look after his best interests. He cites first the commodity marketing committee plan developed by the American Farm Bureau Federation, with the U. S. Grain Growers, as the first new member of the farmers' economic family. Next, he points with pride to the increasing influence of organized agriculture in the halls of Congress. He applauds the Farm Bureau method of presenting an unbiased case based on unquestionable economics. The public in general is beginning to respect the farmer's viewpoint, and for this service also the producer is grateful. In full recognition of the fine, constructive work which the Farm Bureau has already done, the future is all ahead of it."

A state-wide membership drive, re-organization on a three-year basis with a $10 membership fee, and concentration of all organization work in the state federation offices were the essential features of the plan adopted by the executive committee of the Wisconsin Farm Bureau Federation on May 27. In addition to conducting campaigns in the 14 counties already having farm bureaus, organization will be completed in 20 other counties during the summer. Farm bureau members from Illinois, Iowa, and Minnesota will assist in the Wisconsin membership drives. The plan of re-organization adopted by the Wisconsin Farm Bureau Federation was presented by E. B. Heaton of the Department of Organization of the American Farm Bureau Federation.

The Department of Transportation is now housed in the general offices of the American Farm Bureau Federation at 58 E. Washington St., Chicago. Assistant Traffic Manager C. B. Hutchings and Rate Clerk O. W. Sandberg are devoting all their time to farmers' transportation problems. The department's program of work includes the handling of rate adjustments, whereby farmers are aided in reaching all markets to which they are naturally tributary on a parity, and also in maintaining a service division to handle such problems as train schedules for live stock shipments, distribution of cars, etc.

The recommendation of the special committee of the American Farm Bureau Federation that the Wilson Dam at Muscle Shoals, Ala., be completed by the government and that the air-fixation nitrate plants be placed under the direction of a government-owned corporation which may operate the plants or maintain them ready for operation, but with strict regulations of prices for commodities produced, has been approved unanimously by the executive committee. The Wilson Dam, which was started during the war, is about one-third completed. Work cannot be resumed until Congress makes an appropriation of approximately $10,000,000. According to the report of the committee, "the Muscle Shoals project is predominantly neither an engineering nor a chemical problem; it is a business problem which is a concern to the people in all states of the nation; the world is running behind in the production of nitrogen; the price of Chilean nitrate is increasing; the United States paid in 1919, $85,000,000 for Chilean nitrates; nitrogen should be placed on the market at a valuation which is not so nearly prohibitive of its use; to secure a lessened valuation nitrogen must be taken from the air."

THE MILKING MACHINE IN QUEBEC

"We have never had a bad udder or a sore teat," says the manager of Raymondale Farm, Quebec, "caused by the use of our milking machine. Before milking by machine we had considerable trouble with sore teats on account of poor hand milkers."

Eighteen members of the Agricultural Bloc of the House of Representatives met on May 31 to consider agricultural financing. They agreed to get back of the bill providing $50,000,000 in the treasury department for use of the federal farm loan board in floating new issues of bonds. It is claimed that it is impracticable to sell bonds in small lots, as the federal farm loan board will be forced to do if the bill fails to pass. The committee also agreed to push the bill which will raise the interest rate on farm loan bonds to 5½%, but retaining the 6 per cent interest maximum to borrowers. The congressmen indicated their interest also in the bills which would raise the limit on farm loans from land banks from $10,000 to $25,000. The French-Capper Truth-in-Fabric Bill was endorsed and strenuous efforts will be made to have the bill passed.

The Wisconsin membership drive is beginning in Dane County and is being conducted by the state headquarters of the Wisconsin Farm Bureau Federation at Madison. The drive is for three-year memberships and a $10 annual fee. Montana started a membership drive in Yellowstone County on June 7. Charles E. Gunnels spent part of the past week in West Virginia, helping to organize the West Virginia Farm Bureau office. Maine sends in a report showing a total membership of 9,618 in the State Farm Bureau, an increase of 93 per cent above the 1920 membership. North Carolina reports 15 counties organized. New Hampshire reports a Farm Bureau membership of 1,222 in Grafton County, with a prospect of 1,599 by June 1. Every county in New Hampshire and Vermont has voted to increase the Farm Bureau fees from $1 to $5 and $10 and to conduct new membership drives before the end of the year. The farthermost-south report comes from Geneva Co., Ala., reporting a membership of 300.

Treasurer Charles E. Gunnels, of the American Farm Bureau Federation, reports that New Jersey and Vermont are calling state meetings of county farm bureaus to consider the installation of the uniform accounting system worked out by the department of finance of the American Farm Bureau Federation. Inquiries have also been received from the farm bureaus in the states of California, Washington, South Dakota, Georgia, Delaware, Wisconsin, Colorado, and Massachusetts regarding the uniform accounting system.

A 112-page report of the National Dairy Marketing Conference has been published by the American Farm Bureau Federation. The report contains the descriptions and plans of the various successful co-operative milk marketing associations; a chart showing the organization plan of the New England producers; addresses on marketing of cheese, butter, etc., and the resolutions adopted by the conference. The report has been mailed to those who attended the conference and to state federation secretaries. Copies for distribution among milk producers and for use in organization work may be obtained at printing cost —$30 per hundred, single copies 35 cents. Communications should be addressed to the Department of Information, American Farm Bureau Federation, 58 E. Washington St., Chicago.

The resolution authorizing a general survey of agricultural conditions by a joint committee of 5 senators and 5 congressmen has been passed by both the Senate and the House. It provides that an investigation be made in 90 days and that it inquire into the causes of the present condition of agriculture, the difference between the prices of agricultural products paid to the producer and the ultimate cost to the consumer, the comparative conditions of industry other than agriculture, the relation of prices of commodities other than agricultural products to such products, the banking and financial resources and credits of the country, especially as affecting agricultural credits, and the marketing and transportation facilities of the country. The committee is instructed to include in its report recommendations for legislation which will tend to remedy existing conditions and report upon the limitations of the powers of Congress enacting relief legislation.

Senator Norris of Nebraska has introduced a bill (S-1915) which provides for the creation of $100,000,000 Federal Farmers' Export Financing Corporation to buy farm products in the United States and sell them abroad. He declares that farmers are entitled to this credit from the treasury department, for there was a net profit of $60,000,000 to $70,000,000 in the operation of the United States Grain Corporation and this money has never been paid back to the producers. The bill provides for the issuance of bonds up to ten times the paid-in capital. The secretary of agriculture and four other directors to be appointed by the president would control the corporation.

Governor W. P. G. Harding of the Federal Reserve Board advocates a bill authorizing the War Finance Corporation to advance $50,000,000 to the federal reserve banks to be loaned on live stock paper. He believes that the financial emergency which menaced the country during 1920 has definitely passed, but that agriculture, particularly the live stock industry, should be afforded better credit facilities. Live stock paper running not longer than six months is now eligible for rediscount in the Federal Reserve Banks; loans on feeding and fattening cattle are therefore more easily obtained than the longer time loans for breeding cattle and young calves.

Ten national farm organizations joined in a letter to President Harding this week pointing out that "the counterfeiting of virgin wool takes advantage of people's misunderstanding the terms 'all wool', and 'pure wool', which they believe to mean only virgin wool but which may include all grades of substitutes, even the most inferior." The proponents of the bill have been heard, and a few of the opponents. The senate judiciary committee has discontinued hearings for two weeks. It is expected that the manufacturers will be fully represented on rehearing. Wool growers will have to impress on the committee and their congressmen the serious need of this legislation in order to have it passed.

Feeding Phosphorus for Milk

A. M. LOOMIS, DISTRICT OF COLUMBIA

READERS of Hoard's Dairyman will remember a brief article printed about a year ago telling about the experimental work in animal nutrition to increase milk flow, in progress at the Beltsville, (Md.) Dairy Experimental Farm of the U. S. Dairy Division. A professional paper, written by Professor Edward B. Meigs, physiologist, who has had charge of the technical end of this work, and T. E. Woodward, dairy husbandman of the Beltsville Station, is just off the press, under date of May 27, 1921, giving a summary of accomplishments up to date.

The gist of the results of Professor Meigs' investigations is to try to put it into plain English generalities, always dangerous as to scentific discoveries, that under normal rations and normal treatment milch cows lose their power of maintaining milk flow, and that he has localized one controlling factor in this loss of milk producing power in depleted calcium and phosphorus content in the animal body, evidently due to long continued milk production.

His work has indicated that this may be remedied, in part at least, by feeding a ration high in phosphorus. He has found a difficulty in controlling the calcium factor, but has found that by giving the animal a rest of two months, by drying her up that period before calving, and then by giving heavily increased rations, and supplementing the ration by careful feeding of the inorganic salt, sodium phosphate, very marked increase in milk production for the entire ensuing lactation period was secured.

Professor Meigs summarizes the results very conservatively as follows:

"Feeding cows for several years according to the commonly accepted standards with little or no additional pasture, has resulted in their milk yield being reduced below the optimum. The condition of reduced milk yield so brought about may be corrected by giving the animal a dry period of two months, and feeding during that period a ration containing legume hay and grain with a high phosphorus content with three or four times the amount of protein required for maintenance, and two or three times the total nutriment. The milk yield in the subsequent lactation period may sometimes be doubled by this treatment.

"In the case of milk cows of which the milk yield has been reduced by several years of standard feeding, a greatly increased yield can be brought about by feeding "alternated rations with phosphate" during the dry period. This is taken to mean that

(Continued on page 915)

Forty-sixth Annual Meeting of Ayrshire Breeders' Association

AT the request of its western members the Ayrshire Breeders' Association held its forty-sixth annual meeting June 8 in the East returning again to Springfield, Mass. The early plan was to bring the record organization for the red and white cow for its initial meeting in the Middle West, Milwaukee being favored. Breeders in that section, believing the year not propitious for an Ayrshire sale in connection with the meeting in the Middle West, persuaded the association to delay its first western annual session a year at least.

Officers Elected

Paul O. Reymann of West Virginia was elected president for the coming year; H. J. Chisholm, New York, first vice-president; Percival Roberts, Jr., Pennsylvania, second vice-president; Adam Seitz, Wisconsin, third vice-president; and H. M. Kimball, New Hampshire, fourth vice-president. Directors elected for three years are W. P. Schanck, New York; A. H. Higginson, Massachusetts; Stephen Bull, Wisconsin; E. C. Deubler, Pennsylvania; Leonard Tufts, North Carolina; Gilbert McMillan, Quebec; Dudley Wells, Connecticut; and W. P. Bliss, New Jersey. Directors elected to fill vacancies are Dr. T. G. Ashton, Pennsylvania, and C. W. Wilson, Vermont. The executive committee selected from the board of directors has the following members: Paul O. Reymann; H. J. Chisholm; A. H. Sagendorph; A. H. Higginson; Wm. T. Tonner, W. P. Bliss; and W. P. Schanck. J. G. Watson was re-appointed secretary-treasurer.

It was voted that the executive committee be empowered to appear before the Vermont legislature asking that the charter of the Ayrshire Breeders' Association be amended so it may acquire and hold property for the purposes of the association not to exceed $100,000. The amount specified in the original charter was $25,000.

A reciprocal agreement was agreed to whereby the Ayrshire Breeders' Association of America and the Canadian Ayrshire Breeders' Association will each accept animals from the other's country without the recording of their ancestors.

Resolutions were passed expressing the association's sense of loss in the death of its last two remaining charter members, J. Henry Meyer of California and H. R. C. Watson of Vermont.

Reports of Officers

In his presidential address A. H. Higginson gave forceful expression to the belief that the breed needs to give increasing emphasis to production—that the show ring supremacy of the Ayrshire must be maintained but that milking qualities must be given greater prominence. He drew attention to the judging system in vogue in Scotland where recognition is given in the show ring to the production records and pedigrees of animals exhibited.

A. H. Sagendorph reviewed his activities as advertising manager for the association and business manager for its publication, The Ayrshire Digest. He closed his report with the statement: "The Ayrshire Breeders' Association is out to do business for the coming year with the belief that it is going to come to those who fight for it. The Ayrshire breed is now on the map. We can keep it at the front if we have the co-operation of all the breeders".

Secretary-treasurer Watson reported an increase of 661 in registrations over the number in the previous year, 5,261 females being recorded and 1,548 males. Transfers showed a decrease of 116, the number being 4,370. During the past year 172 new members came into the association making the present total 1,597. Mr. Watson's records show the year's income to be $41,047.47. The total expense was $41,672.46.

The National Ayrshire Sale

The usual custom of holding the National Ayrshire Sale on the day following the association's annual meeting was prevented this year by a conflicting sale. It was therefore called for June 7th, on which day 72 head were sold on the Eastern States Exposition grounds for a total of $28,220. The top of the sale was the bull, Howie's Topnotcher, consigned by Alta Crest Farms, Massachusetts, and secured by J. W. Alsop of Connecticut for $1,025. The highest priced female was Jean Armour's Red Kate, consigned by W. P. Schanck of New York, and taken by L. W. Newton, Massachusetts, for $1000. Mr. Alsop was the heaviest buyer taking 12 head for $4,960. Lippitt Farm, Rhode Island, was a close second, securing 11 head for $4,270.

A list of animals selling for $400 or more is given below with the names of their buyers:

Lippitt Farm, Rhode Island	
Evamere's Bertha	$650
Ouimet	400
Cavalier's Violet of Spring City	500
Howies Flash Girl 4th (Imp.)	525
Edw. Chapman & Sons, New York	
Nona's Middlesex Chancellor	$500
H. J. Chisholm, New York	
Douglas Hall Fern	$775
Bellefonte White Beauty	400
J. W. Alsop, Connecticut	
Howie's Topnotcher	$1025
Patient of Brierwood	450
Barclay's Blackbird 2d	525
Baron's Dainty	410
The Abbess of Highland 2d	450
Bonnie Burn	450
Buttercup of Wilburton	450
Montdale Farm, Indiana	
Picken's Sunray (Imp.)	$625
Petchora's Pride	725
Cavalier's Blanche Cleopatra	500
Old Forge Farm, Pennsylvania	
Miss Castle 2d of Hill Top	$400
Weymouth Farm, Massachusetts	
Monstone Stately Queen	$625
H. O. Dennes, New York	
Petchora's Pride of Hillcroft	$525
Wendover Farm, New Jersey	
Meg Gretchen of Bonnie Doone	$550
A. H. Cole, Massachusetts	
Burnside Mary of Bonnie Doone	$400
Delchester Farms, Pennsylvania	
Sarah Lee of Bonnie Doone	$675
Fairlea Farms Co., Connecticut	
Yellow Kate's Dandilette	$400
Loudoun Flash Girl	435
L. W. Newton, Massachusetts	
Jean Armour's Red Kate	$1000
Barclay Farms, Pennsylvania	
Nancy's Mint Master	$775
Barclay's Blanche 2d	650

Washington, D. C., Weekly News

[SPECIAL TO HOARD'S DAIRYMAN]

WASHINGTON, JUNE 14—In spite of a protest against what they termed a snap hearing, introduced by the attorney for the cocoanut oil refiners, the proponents of the Voigt filled milk bill got in a full hearing on this bill on Monday forenoon. The opponents asked for a two-week delay, but this was not granted, and Congressman Voigt, A. J. Glover of Hoard's Dairyman, Professor E. V. McCollum of Johns Hopkins University, Seward A. Miller of the Dairymen's League, and others told the Committee on Agriculture just what there is to the filled milk menace to health and the dairy industry.

This is the first time this question ever came officially before Congress in any way. The story of this counterfeit milk was new to several members of the committee and as a result the hearing, although it was not productive of any definite results, is considered a good beginning toward federal curbing of this menace to health, as Professor McCollum characterized it.

The pressure of business before the Committee on Agriculture makes a hearing here a much different affair than a hearing before a legislative committee. When the hearing was not completed at noon, it was necessary for the committee to arise, so that the members could go to the House which was then in session. It was also impossible to go on the following day as another hearing was scheduled on the cold storage bills.

Witnesses present but not heard included R. W. Balderston and A. A. Miller, representing the Inter-state Milk Producers' Association of Philadelphia, who were present with the results of a survey of the cities and villages of Eastern Pennsylvania and New Jersey, showing how these imitation products are crowded on the public by retailers. W. D. Engals of the Borden Condensed Milk Co. and the representatives of the farm organizations in Washington were the only one primed to endorse the principle of regulating or prohibiting this industry.

The case was opened by Congressman Voigt who made the argument for the bill, after stating its purpose. He said that the dairy industry could not survive this kind of unfair competition, that the human race could not live on milk with the cream removed and vegetable oil substituted. Two new features were added by Congressman Voigt near the close of his statement, one that the condensed milk manufacturers now making only the pure product were being forced into the manufacture of the imitation product and were here asking to be given an honest law that would permit them to make an honest product that would not be driven out of business by a dishonest one, and that the export trade in milk which was a saving factor of the present milk surplus was in danger of being lost by reason of the imitation product just as the filled cheese business of the early eighties ruined the American cheese export trade. He presented for the record a statement on this latter subject showing the actual results in the exports of cheese declining from a yearly total of one hundred forty million pounds in 1881 to less than 50,000,000 pounds six years later and then down to 1913 when this nation imported twenty times as much cheese as it exported.

Dr. McCollum of Johns Hopkins University was the star witness for the proponents of the bill. His statement to the committee was pronounced by those who have heard him before various state legislatures, to have been the finest presentation he has ever given of his discoveries and investigations showing the essential character of milk in the diet and the dangers of the substitution of filled milk for real milk. Rather than attempt to summarize this statement, your correspondent prefers to wait until the transcript is available, and present next week some verbatim extracts from what he said. He had every member of the committee leaning forward in their chairs as he showed the pictures of the rats fed experimentally with rations deficient in milk fats and those fed on properly balanced rations.

The rats without milk had developed both eye ulcers and blindness and others had suffered from rickets. Both were cured, he said, by feeding milk, but in no case were normal conditions ever brought back to a rat fed for a time on a deficient ration. Neither, he said, could it be done with a human being.

"No vegetable oil," he said, "contains vitamines in sufficient amount to take the place of dairy products in a ration which will preserve the full measure of health in an adult or growth in a child. No diet will postpone senility, prolong vigor, and keep up health except one with abundant dairy products in the bill of fare. If you want to be like the Chinese or Japanese, stop work, sit down, and grow whiskers at fifty and let your children support you, then go without milk. There is no example of this like the example of the Blackfeet Indians on their reservation. They were in past generations carniverous men, eating only meat. Now they eat store groceries, breakfast foods so poor in nutriment that weevils can not live on them, and that is the reason there are no weevils in these breakfast foods. These Blackfeet are old at forty, their teeth are gone, they have rheumatism, and are senile when milk fed men are in their vigor."

Mr. Glover spoke forcefully of the relative success of the wheat growing industry and the dairy industry as demonstrated on the farms of Wisconsin. He asked for this legislation to preserve the dairy industry. "I want a law which will relieve the American dairymen from competition with a cocoanut tree in the South Sea Islands, and a native whose only cost of production is a strap around his waist to help him climb the trees," he said.

Seward A. Miller, former attorney for the New York State Department of Farms and Markets, told of the conditions existing in the cities of New York where children, foreigners, housewives, and others were imposed on by dealers who could make a few cents more a can by selling this counterfeit milk, as he called it. "The dairy farmers of New York want a law on this subject just as stringent as the law against counterfeit money," he said. "This product is a counterfeit, nothing less. The Supreme Court says the label does not protect. We want a law which will protect."

The committee could not set a date to go on with the hearing. Three other subjects are scheduled, and this will come on when those hearings are completed, probably not until early in July.

Several members of the staff of the Dairy Division and the Bureau of Chemistry, Department of Agriculture and several members of the Internal Revenue Bureau, have been called this week to St. Paul, where a seizure of butter has been made for alleged violation of the moisture standard. The full details of the case are not announced here, but it is said that an effort is to be made to clear up some difficulties in the enforcement of the Bureau of Internal Revenue rulings in this proceeding.

Subscription Rates

Subscription in United States and Mexico $1.00 per year; 3 years, $2.00; Canada, $1.50 per year.

FOREIGN SUBSCRIPTIONS may be sent through news dealers and book sellers in all foreign countries.

All foreign countries in the Postal Union $2.50 a year; not in the Postal Union $3.00, including postage.

Correspondents must not expect us to acknowledge the receipt of letters containing remittance for subscription. The receipt of Hoard's Dairyman is sufficient notification that money has been received. The label on the paper will show date to which subscription is paid. In case of renewals, if date on label is not changed within two weeks after remittance is sent, inform us at once.

We solicit advertisements of meritorious articles needed by the farmer. We try to keep our advertising columns clean and wholesome, that they may merit the patronage and confidence of our readers. Unwholesome, immoral, and quack medical advertising are excluded. A sincere effort is made to exclude frauds, irresponsible and unscrupulous firms. We will always take it as a favor to be notified whenever any advertiser's dealings with a subscriber are in bad faith or evidence a lack of business honor. Advertisers generally recognize the readers of Hoard's Dairyman as an up-to-date class of farmers, who farm with business-like methods, and we hold our columns for the patronage of only those with whom our readers can deal with profit and satisfaction.

ADVERTISING COPY must be received eight days previous to the date of publication. Advertising to be classified or changes in advertising must reach us twelve days previous to date of publication.

Entered at Fort Atkinson, Wis., as second class matter.

Oct. 8-15—National Dairy Show at Minnesota State Fair Grounds. Manager, W. E. Skinner, 910 So. Michigan Ave., Chicago.

Advanced Registry Testing in Pennsylvania

According to a report issued by Paul S. Williams, in charge of Advanced Registry testing for Pennsylvania, there were 739 cows in 113 herds that were on yearly test in Pennsylvania during the month of April. Of these cows, 237 were Ayrshire, 198 Guernsey, 146 Jersey, 151 Holstein, and 7 Shorthorns.

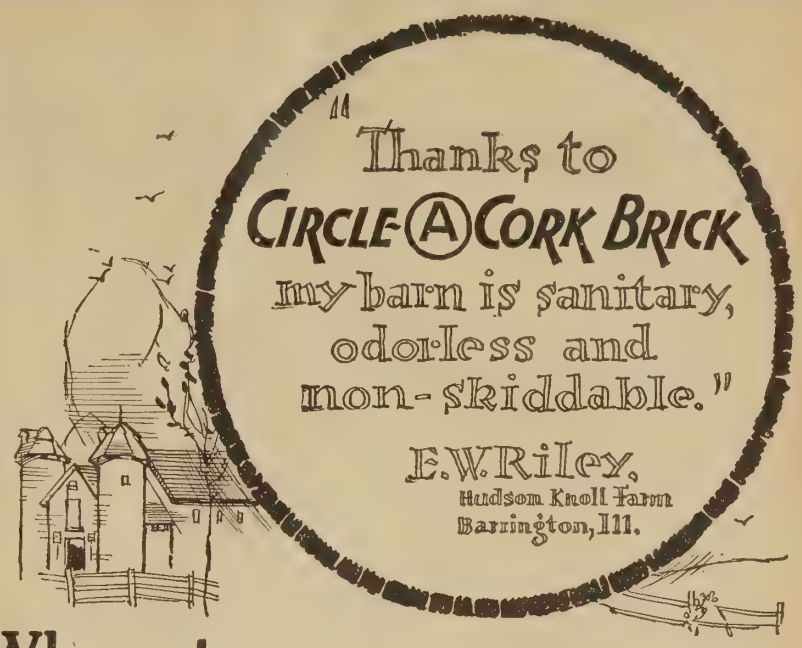
There were 31 farms reporting seven-day official tests, 3 cows being reported with records of over 30 lbs. butter in 7 days.

Seeds rhyme with weeds; which is a good reminder that the latter ought to be cut before the former develop.

Massachusetts Guernseys Sell for $710 Average

Seventy-four Guernseys sold in the Massachusetts Guernsey Breeders' Association's first combination auction at Langwater Farms June 9 for $52,545, an average of $710. Nine bulls included fell short of the sale's average by $100. The offering was made up of drafts from 17 herds and had been selected for sale by the association's committee: F. L. Ames, L. F. Herrick, George W. St. Amant, Walter Kerr, and Richard Harwood.

The high price of the day, $5,000, was paid by R. L. Benson of New Jersey for Langwater Sheen, consigned by Langwater Farms, a five-year-old daughter of Langwater Model and out of Langwater Lustre. On test in Class B this cow is making two pounds of fat per day. Mr. Benson took two others, one being Langwater Vampire at $2,700, also from Langwater Farms, by Langwater Steadfast, and out of a daughter of Langwater Warrior. Fifteen head consigned by Langwater Farms averaged $1,158. The heaviest buyer was Howard Brewer, Massachusetts, who took 11 head at the very low average of $366, securing a number of splendid individuals of that valuation. W. K. Hepburn of Massachusetts bought six head at an average of $437.



E. F. Price of New York paid $3,000 for Itchen's Golden Daisy of Chilmark, consigned by F. L. Howes. This cow is present world champion in Class DD with a production of 14,367 lbs. milk, 669.64 lbs. fat and was favored by some as the head liner of the auction. Three good ones went to Wm. Flynn of Pennsylvania; Langwater Elegance for $2,200, and the full sisters, Princess Isabella of Riverdale and Princess Helen of Riverdale for $1,000 each.

As pleasant preliminaries to the sale Geo. W. St. Amant staged a field day at his farm on Cape Cod on June 8 and the Guernsey Association supplied a banquet to about seventy-five breeders in the evening. The visit to Mr. St. Amant's herd gave breeders an opportunity to go over the high class animals which have been gathered so largely from the auction rings of the past year and a half. The quality of the cattle and the full measure of hospitality extended made the day well worth while to the eighty who made the trip.

The Sale Prices

Below is given the prices of all animals selling for $700 or more, with the names of their buyers:

E. T. Price, New York	
Itchen's Golden Daisy of Chilmark	$3,000
W. M. Flynn, Massachusetts	
Princess Isabelle of Riverdale	$1,000
Princess Helen of Riverdale	1,000
Langwater Elegance	2,200
W. S. Dunn, New York	
Deanie's Marose of Appletree Point	$925
W. B. Mahoney, New York	
Yeoman's Mixter Glen	$925
R. M. Macintosh, Massachusetts	
Yeoman's Mixter Symphony	$850
J. S. Ames, Massachusetts	
Don's Victime of Oaks Farm	$1,300
Imp. Green Meadow Ada	2,600
H. L. Tinkham, Massachusetts	
Janet Fisher	$1,525
Glen H. Briggs, New York	
Upland's May Rose	$850
Howard Atwood, Massachusetts	
France's Bellinda of Big Spring Farm	$1,500
L. S. Cox, Massachusetts	
Lady Methuen	$750
R. L. Benson, New Jersey	
Langwater Sheen	$5,000
Langwater Vampire	2,700
Howard Lehman, Massachusetts	
Langwater Vigilant	$1,550
C. C. Bolton, Ohio	
Langwater Penitent	$1,250
M. M. Van Beuren, Rhode Island	
Langwater Sea Lord	$1,100
Harbor Hill Farm, New York	
Imp. Green Meadow Cleopatra	$825

Why not make your barn the same?

Install a floor that will contribute to the health, safety and productiveness of your cows. For example, a floor of Circle A Cork Brick. There is comfort in the warmth and resilience of a cork brick floor, and security against slips and falls in the firm foothold its surface affords. It is nonabsorbent of moisture or odors, easy to clean, remarkably durable and reasonable in cost.

Circle A Cork Brick Floors
FOR DAIRY BARNS AND HOG HOUSES

afford the qualities that are essential if the diseases and accidents caused by cold, hard, slippery floors are to be avoided. As many owners say, Circle A Cork Brick are ideal for stall floors.

In the 28-page book, "Better Stall Floors," you will find a wealth of information for the progressive dairyman. A copy of the publication, together with a sample of brick will be sent upon receipt of your request.

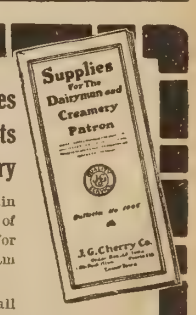
PITTSBURGH, PA.

Shoo-Fly THE ANIMALS' FRIEND



For keeping flies and many other insects off animals. Used and endorsed since 1885 by leading dairymen. Cows give 25% to 35% more milk during fly season if sprayed with Shoo-Fly.

$1.50 worth saves $20

in milk and flesh on each cow in a single season. Excellent for galls. Allays itching. Aids in healing cuts and sores. Excellent for lice and mites in poultry houses.

Send $1.50 for enough Shoo-Fly to protect 10 cows 2 weeks, also our 3-tube gravity sprayer. Money back if not satisfactory. Name Express Office. Booklet FREE.
SHOO-FLY MFG. CO., 1316 N. 10th St., Phila.

How to Stop Losses and Increase Profits In the Farm Dairy

Our handy little Bulletin 1005 "C" is chock full of practical suggestions for handling milk and cream in the farm dairy.

By following it, the small dairyman can deliver his products to the creamery, the city milk or ice cream plant in just as good condition as the biggest of them. And get the same top-notch prices. When you send for the booklet (it is free) state number of milk-cows you own or gallons of milk you produce per day, so our service department can advise you.

EDITORIAL COMMENT

SKIMMILK AND TUBERCULOSIS

We wonder if every breeder and dairy farmer fully appreciates how essential it is that whey from the cheesery or skimmilk from the creamery be heated to a temperature of 145 to 155° F. before feeding. There is no better way of infecting a herd with tuberculosis than to feed unpasteurized skimmilk or whey from the creamery or cheesery. If the milk from one herd suffering from tuberculosis is taken to a creamery, all the skimmilk may be capable of spreading tuberculosis. No dairy farmer or breeder can take the chance of feeding raw skimmilk or whey to his calves or pigs.

Recently a dairy herd was tuberculin tested. None of the cows reacted to the test, but there were a number of reactors among the yearlings. This was an unusual incident, for in most herds if there are reactors among the young stock there are reactors among the cows. Upon investigation it was found that the farmer was feeding raw skimmilk from a creamery. This accounted for the reacting heifers.

How unfortunate is this case! This man without doubt had a clean herd of cows, but now it is infected with tuberculosis by the feeding of raw skimmilk. It will take years for him to get rid of it, for when once a herd becomes thoroughly infected with tuberculosis it requires eternal vigilance upon the part of the owner and a long time to eliminate it.

Every state should have a law requiring the creamery and cheesery to pasteurize their by-products, unless it is positively known that all herds that supply milk to any institution are free from disease. It would not be practical to obtain such knowledge, and the only way to be safe is to heat the whey or skimmilk before feeding it.

The safest way to keep a herd from getting infected skimmilk is to separate the milk on the farm and sell the cream. Any farmer who feeds raw skimmilk from the creamery can make up his mind that his herd will sooner or later be infected with tuberculosis and expending money for tuberculin testing to determine whether tuberculosis is in his herd, is wasted. We would not consider it advisable to apply the tuberculin test to any herd where the calves are raised on raw skimmilk from the creamery. The loss from tuberculosis, taking it by and large, will be great enough to satisfy any man without adding the expense of tuberculin testing.

DAIRY FARMERS VICTORIOUS

Through the co-operative effort of the dairy interests of Wisconsin, a bill to prohibit the manufacture and sale of filled milk has passed the legislature. It is a splendid victory for the dairy farmers of Wisconsin. Strong concerns were opposed to this legislation but their representatives failed to convince the assemblymen and senators that they were manufacturing a meritorious product. It was argued by the opponents of this bill that they were providing a market for skimmilk and that condensed skimmilk and cocoanut oil were wholesome foods. The proponents of the bill argued that instead of filled milk providing a market for skimmilk it took away a market for butterfat. No one denied that filled milk is a wholesome food. So is corn meal, oat meal, etc., but no food takes the place of milk.

The chief points at issue were: Filled milk is a fraud, because it is advertised and sold as milk and is injurious to the dairy industry. Since milk is our only protective food it must be protected from compounds which so imitate it that they can be sold and used as milk. The intelligent mother has always looked to milk as a perfect food and one that will properly nourish her babies and children. In late years new knowledge regarding milk has been found. Its importance to health and growth is far greater than was formerly supposed. In view of this knowledge the only way to protect milk is to prohibit the manufacture and sale of a compound which looks and tastes so much like milk that it can be sold as such and in this way become an instrument of fraud and deception.

The Supreme Court of the United States, in rendering an opinion regarding filled milk, says: "The constitution of the United States does not secure any one the privilege of manufacturing and selling an article offered in such a manner as to induce purchasers to believe they are buying something which is in fact different from that which is offered for sale."

This is a strong decision in favor of honest food products, and should the manufacturers of filled milk carry their case to the courts, the decision of the United States Supreme Court will be of no mean assistance to consumers' interests.

Filled milk is injurious to the dairy industry because it provided a market last year for seven million pounds of foreign fats and placed eight million pounds of butter upon the market. The dairy farmer cannot compete with the cocoanut cow of the South Sea Islands. He has large investments in buildings, land, and equipment and the native of the South Sea Island needs only a strap for climbing trees to gather cocoanuts. The dairy farmer is not only producing an essential food product, but he is also building a permanent system of agriculture which is the very foundation of the nation. His interests must not be jeopardized. They must be protected for the good of all.

The victory of the Wisconsin dairy farmers should stimulate all states to follow their lead. Filled milk must go.

"THE LAST COW"

Under the caption "The Last Cow", the Holstein-Friesian Register of May 15th discussed tuberculosis eradication and in the same issue published a cartoon which presents not only an exaggeration, but a false interpretation of the subject it desires to present. We regret that a publication like the Holstein-Friesian Register has failed to understand the meaning of tuberculosis and why effort is being put forth to eliminate it from our herds. False and inaccurate statements, as well as misleading implications, are expressed in the cartoon and in the editorial.

The Register holds that "tuberculosis eradication is stimulated by a certain frenzy in the public mind, based wholly upon an implicit reliance on the opinion set forth by professional men that bovine tuberculosis is communicable to the human race through the consumption of milk." This statement shows the ignorance of the Register as to the real purpose of eradicating bovine tuberculosis.

The public health can be protected through the pasteurization of milk, but the only way to protect the breeder from heavy losses is through the elimination of tuberculous animals. No breeder can afford to keep a tuberculous herd of cattle, for he is the one who sustains the loss. He sustains it in the extra feed he must give to animals suffering from this disease to keep them in first class condition; he sustains it in the loss of animals upon his own farm; he sustains it in the cattle sent to the tanker unfit for human food; he sustains it in the loss of hogs sent to the tanker. The packing interests do not sustain this loss, but the farmer who sells his cattle and hogs to them is the loser. Tuberculosis, to a large extent, is an economic question and the sooner breeders and dairy farmers appreciate this, the sooner will they desire to eliminate this loss.

We are surprised that the Register has not found facts concerning the transmission of bovine tuberculosis to human beings. It is now generally believed that adults seldom become affected with bovine tuberculosis, but children seem to be susceptible to it. In a special investigation made in New York, where 603 cases of human tuberculosis were studied bacteriologically, it was found that only 8 out of 389 who were sixteen years of age or over were affected with bovine tuberculosis. Of 78 tubercular children between the ages of five and sixteen, 24 were affected with bovine tuberculosis while out of 136 tubercular children under five years of age, 37 were affected with the bovine type.

Dr. Park states that from 200 to 300 children die in New York annually with tuberculosis of the bovine variety. Yet the Register asks, in substance, "How do we know that bovine tuberculosis is transmitted to human beings?" and then asks, "Has the government absolutely proven it to be so?"

The Register also says that many injections of the "serum", meaning, we presume, tuberculin, may cause the animals to become inoculated with the disease. Here, again, the editor of the Register shows his ignorance of tuberculin. There is no opportunity for tuberculin to convey tubercular germs to animals. Tuberculin, or rather the tubercular bacteria from which it is prepared, is heated to a temperature which destroys all tubercular germs. It is then filtered and preserved in carbolic acid in which no germ could possibly live. There is no possible chance of tuberculin properly made, to infect an animal. If the animal is not infected with tuberculosis the tuberculin can cause no harm.

The tuberculin test is not 100 per cent accurate. It is not infallible. However, we know from our own experience that through the careful application of the tuberculin test a herd may be kept free from tuberculosis. For twenty years the Hoard's Dairyman Herd was tested without a reactor. A year ago we found one, which was promptly eliminated. The herd was tested again six months later and found to be clean. We know that tuberculin does not in any way injure cattle that are free from the disease. We know also that we have saved our herd because we located, through tuberculin, a cow with tuberculosis.

The Register again displays ignorance when it discusses the consumption of beef from animals suffering from tuberculosis. In the first place, those animals whose flesh is affected are sent to the tanker. Even though they were not, proper cooking destroys the tubercular germs. Inspection does safeguard the public.

The question of tuberculosis becomes very largely an economic one. The dairy farmer and the breeder who keep tuberculous herds of cattle are the ones to suffer the most, and it is to their advantage, both financially and from the standpoint of health, that their herds be clean from this disease. The application of the tuberculin test and the handling of the herd requires a knowledge of tuberculosis or else serious and costly mistakes will be made.

It is a great disappointment to us that the Register has shown so small a comprehension of tuberculosis and the methods for its eradication. Many breeders and farmers desire to believe just what the Register has published, and they will accept these statements, misleading as they are, as being true and in the end will suffer heavy financial loss.

It is to the breeders' and dairy farmers' interest that they test their cattle with tuberculin and eliminate the reactors.

Bull Calf Queries

I recently purchased a pure-bred Holstein bull that will be six months old in June. Could he run in a pasture with unbred cows and young heifers a few months yet and if so, how long?

What about putting a ring in his nose? Should I put in a small one now and replace with a larger one later, or can I put in a full sized ring now or as soon as I need any?

What method do you recommend for dehorning my bull and the two five-months' heifers? I use caustic potash on my own calves but these were too old when received.

How soon and how much could I begin breeding with my bull? I have to use a neighbor's scrub bull until I can use him.

Onida, S. D. R. H. B.

The bull calf should be separated from the heifers by the time he is six months old, if not before. He will be sufficiently mature for light service at

10 to 11 months of age. It is advisable, however, to breed him to not over five or six cows before he is one year of age. When he is from 12 to 15 months old, he may be bred to not over one or two cows per week. As he becomes better developed, the amount of service may be increased. Much will depend upon his growth and general vigor. Ordinarily, we would prefer to give no service until after 12 months of age but to escape use of a scrub it would be preferable to use him for light service when he reaches the age of 10 months.

When the bull is about one year of age, a ring should be placed in his nose as a convenience in handling. It is scarcely necessary to ring him when he is six months old but much will depend upon the animal himself. When he is a year old, the ordinary bull ring may be used but care should be exercised to examine the condition of this ring from time to time in order that a new one may be inserted before the older ring becomes badly worn and insecure.

It is somewhat difficult to give instructions as to dehorning as this may best be learned by observing some one else. We would suggest that the services of a veterinarian be secured or of some neighbor who has done the work heretofore. The actual dehorning will be done with the saw or a pair of clippers and the animal should be at least one year old and preferably two, as otherwise there is danger that scours or false horn growth will develop. The horns should be cut from a quarter to a half inch below where the skin joins the horns, leaving a rim of skin on the horn removed. The dehorning is best done in the cool weather of spring or autumn. If done in hot weather special care should be exercised to keep flies out of the wound.

Directions as to the tying of animals for dehorning with saws or clippers and details concerning the work will be found in Farmers' Bulletin 350, which may be secured from the United States Department of Agriculture, Washington, D. C.

A Clarifier Gets It

HOARD'S DAIRYMAN:—In reply to P. J. C. regarding straining swamp muck out of milk, would say that I have had over fifty years' experience with swamp muck on cows' udders; have tried all kinds of strainers, filter cloth, absorbent cotton strainer that strained up instead of down, but to no avail. A few years ago I bought a clarifier that gets everything you can see, but while the clarifier removes much of the bacteria, it still multiplies the bacteria count because it breaks the cells.

The editor's suggestion that it is better to keep dirt out of milk is good, very good; but, he might get down on his knees and wash a cow's udder that was covered with muck, wipe dry with a towel, then go over it with a magnifying glass and he would find dirt would still show in the bottom of the milk bottle.

Bristol, Conn. S. D. N.

Yes. We have gotten down under a cow's udder with a basin of water and a towel, and we know just how difficult the job is. We have not always been successful, for we confess that in summer dairying there are days so long that the will to do grows weary after getting the last load of hay in the barn and the cows have been driven up. The clarifier would have helped us at those times, but we would still try to clean the udder as well as we could.

Herd Varies in Test

HOARD'S DAIRYMAN:—I noticed the inquiry of A. P. of De Lancey, N. Y., relative to variation in fat test and it prompted me to write of my experience along that line.

In March we began retailing the milk from our small herd and the first month there were three days that the cream on the bottles was fully 25% less than normal. The decrease began one day, reached the low point the second day, and was almost back to normal the third day.

Four of the cows are registered Jerseys testing close to 6% and the others are good average grades testing around 4% or a little better. We aim to keep our fat test up to an average of 5% as we get two cents above the price for 4.2% milk. Experience has taught us to expect this drop in cream approximately every twenty-eight days and at those times we have to keep out the milk from the lowest testing cows and skim it for what cream we can get.

We attribute this variation to the commotion caused by the cows and heifers not bred. We do not believe feeding has any bearing on the subject for the cows are always given the same rations and the same feed at the same hours each day. Their rations consist of corn silage, a commercial dairy feed, and one hour of grazing on good grass each day. As soon as suitable arrangements can be made we plan to separate the heifers and cows not bred from the others during this period to ascertain what the effect will be. This drop in the quantity of cream causes no end of annoyance, whatever the cause may be.

Kalamazoo, Mich. A. V. L.

Sunflowers in Massachusetts

HOARD'S DAIRYMAN:—I have made a practice of mixing 3 or 4 quarts of sunflower seed with each bushel of seed corn planted for the silo, almost continuously for 15 years. I have always figured I got an increase in the amount of fodder per acre with no sacrifice of quality.

The increase in material for the silo is particularly gratifying in an off corn year, when, by reason of unfavorable weather conditions or poor or late fitting of the soil, corn bids fair to make about a half a crop. Sunflowers thrive under conditions which practically spell failure for corn alone. I find that cows eat the silage resulting from the corn and sunflower mixture equally as well as that made from corn alone and have never been able to detect any inferiority in the mixture from the standpoint of milk production.

There are, however, two disagreeable features connected with the crop which may be more or less serious. The sunflowers are very hard to handle from the field on account of the great weight of the heads, making the bundles top heavy and inclined to spread apart. In feeding the mixed silage the action of the kidneys is very much increased, the result being a practical doubling of the urine voided by the cows and consequently requiring much more care to keep cows and stable in presentable condition.

In spite of these seeming drawbacks, however, I shall continue to grow the mixture and intend to plant a field of 10 to 12 acres to sunflowers and soybeans leaving out the corn entirely. This will be to try out this combination on a low, wet field which I do not expect to be able to get ready to plant until somewhat too late for corn to do its best.

Wayland, Mass. L. C. L.

Producing Milk for Sale

HOARD'S DAIRYMAN:—Profit is the object of producing milk as it is the object of any business. If you think your margin of profit or your total profit from milk is not what it ought to be, take out your pencil and paper, and see how you stack up on this little schedule, which shows how some of the factors are related to each other.

How much profit? This depends on two things: How much did you make on each hundred pounds you sold, and how many hundred pounds did you sell?

I. The margin of profit per hundred pounds depends on

1. The price you got for a contract period.
2. The cost of a hundred pounds of milk under your conditions.

Costs vary as follows:

a. The outlay incurred in producing the milk.

b. The number of hundred pounds you produce and sell.

II. The number of hundred pounds produced is affected by the following:

1. The production per cow.

a. The natural capacity of the cow.

b. The amount of feed given and consumed.

c. Other care, including milking season, service, etc.

2. The number of cows in the herd.

a. The amount of milk wanted for sale and home use.

b. The capacity of the individual animals.

c. The capacity of the barns and to some extent of farm.

d. Labor conditions.

3. The facilities for handling the product.

Any of these factors may have a limiting effect on the amount of milk produced and so on profit. But if the cost per hundred pounds exceeds the price received, the more produced the worse off you will be.

The cost of milk as usually figured is an "opportunity cost"; that is, using the item feed as an example, feed is figured at the prevailing market price when it really costs less than market price. The meaning of a loss in the dairy enterprise is then that the rate used as the value of feed has not been realized. The net results of the whole farm operations then determine the course to be pursued; if it is too small for family comfort there will be discontent and a change to some other line of effort. If in spite of an apparent loss the family income is ample for family needs, nothing will be done toward improving conditions. Further, a farmer who depends on milk for his whole income will stir himself to action sooner than one who sends in a few hundred pounds a day, but so much milk is produced by these small producers that the bargaining power of the real producers is handicapped.

"Opportunity" costs have helped a lot in improving conditions of production, in weeding out boarder cows, in directing the lines of profitable productions. Still the price offered for milk does not bear any close relation to "opportunity cost", being based on the supply available and what consumers are willing to pay. There is a necessary minimum amount of milk for infant and hospital use for which a dollar a quart would be paid if necessary, but above this minimum the amount consumed varies with the price asked, the relative value of milk as compared with other foods, and the habits of the people. Milk is even now a very economical food, and increased use should be promoted by advertising and example. The tendency is to restrict milk production under the present high prices of things the farmers have to buy, but if the whole situation with regard to these items is comprehended, the question naturally arises whether the best policy may not be to produce more milk even at a slightly lower margin per hundred pounds and thereby increase the total net income of the farm by turning more farm products and farm labor into milk and through milk into money.

Looked at from two points of view the farmers have a peculiar duty to find out the facts of production; if their margin is really good they should see to it that it is maintained; if it is as poor as complaints would lead us to believe at times, they need all the evidence they can marshall in support of their contentions. Changes will be made rather conservatively, extending the time available for finding out facts, but no time should be lost in getting to work on the problem. The problem is partly one of general organization of milk producers, but during the time before this is effective, any individual may do much for himself by carefully adjusting the various factors to the end of greatest net profit for the farm.

Wis. College of Agriculture. S. W. MENDUM.

Better System Means More Profit

HOARD'S DAIRYMAN:—At present it is difficult to make large profits from the dairy farm, even if the dairy farmer is better situated than the man who is dependent on the grain market. It is therefore necessary to study the situation in order to see what can be done in the way of improving it.

Until the farmer gets strongly organized he is left to take what the public offers for his products and to give a big commission to the middleman. At present there is only one way to make more profit; that is, reducing the cost of production.

There are several ways for most men who milk cows to go at this, and here they are in a nutshell: Keep healthy and higher producing cows and care for them in the right manner. It is a hundred times easier to prevent a herd from getting disease than to get rid of diseases once in the herd. To prevent two of the most common diseases, tuberculosis and abortion, there are a few things that count very much and are comparatively inexpensive: Fresh air, sunshine, plenty of fresh water, salt, and healthy feeds, also cleanliness of the barn and cows, a little air slack lime spread on the barn floor daily, and whitewashing of the barn twice a year may save their cost many times.

One of the surest ways of securing good producers is to keep records of the herd. Sell the poor producers and raise calves from the best cows and always use a bull with good dairy type and breeding, whose ancestors have proved to have ability to transmit production.

It is good business to know your cows and know which are good producers and which are loafers, and last, but not least important, is feeding of the cows, a big factor in securing the best profit. Cows should be fed a liberal and well balanced ration according to production, with as much home grown feeds as possible. In most cases it is necessary to secure some protein concentrate but also the prices on the various protein feeds should be taken in consideration.

Illinois. ANTON CHRISTIANSEN.

FISK TIRES

Tire Mileage

at the

Lowest Cost in History

NON-SKID

30 x 3½

$15.00

Grey Tubes $2.55

Prices reduced on all styles and sizes

It is so easy to be safe in buying your tires — you need only say "Fisk" and be sure of getting extra mileage, extra comfort, freedom from ordinary tire troubles, and at the same time save substantially on every tire you buy.

Sold only by dealers

A New Low Price on a Known and Honest Product

Fond du Lac County Sells Guernseys

Fond du Lac County, Wisconsin, held its fourth semi-annual sale at Fond du Lac June 3, selling 52 animals for $12,285, the females bringing an average of $260.70.

F. J. Reuping consigned the top priced animal of the sale, a splendid 2-year-old daughter of Ultra King of Edgemoor, from a 500-lb. dam. She was purchased by L. P. Martiny, Wisconsin, for $530.

Pohlman, Jones, and Bergen did the selling with Sale Manager C. L. Hill in the box.

Following is a list of those animals selling for $300 or more and buyers:

A. L. Sheldon, Minnesota	
Jessie of Herodale 4th	$320
Jessie of Herodale III	320
Guida of Sarnia	410
Lone Tree Ruby Lass	315
Crackerjack's Dot	360
Lady of Birchwood	450
B. F. Sheridan, Wisconsin	
Model May 2d	$405
R. E. Fisher, Canada	
Lone Tree Lilith	$300
Chas. Ruelke, Wisconsin	
Arlene of Ore Hill	$325
Fern of Eaton's Bell	325
L. P. Martiny, Wisconsin	
Ultra May Rose of Sunny Valley	$530
Goldseeker's Lady Charlotte	300
H. A. Retzleff, Wisconsin	
Walter Sequel's Christine	$310
M. L. Welles, Wisconsin	
Fair Oaks Beda	$305

Waukesha County Guernsey Sale

Waukesha County Guernsey breeders at their semi-annual sale, June 9, at Waukesha, Wis., sold 52 head for $10,570 with $600 the top figure. Fruit Bros. received this for an excellent 2-year-old granddaughter of May King's Vrangue of Ingleside. She was purchased by Geo. Konrad, Wisconsin.

Bidding was slow throughout the sale but, although prices were low, the quality was pretty well up to the standard of previous sales and certainly every buyer should feel satisfied.

Love, Benjamin, and McGuire did the selling with F. E. Fox in the box.

The following list includes those animals selling for $300 or more:

Wm. K. Patey, Wisconsin	
Christabel's Rose of Waukesha	$315
Dairymaid's Sunbeam of Fox Valley	305
C. J. Mitchell, Wisconsin	
King of the May's Fern	$400
Geo. Konrad, Wisconsin	
Royal's Pride of Maple Hill	$600
Dolly Bloom's Moyra Rose of Midlothian	300
May Rose of Tillybarden	420
W. D. James, Wisconsin	
Pearl's Ultra Topsy	$325
Clyde Fruit, Wisconsin	
Governor's Rosette of Walnut Ridge	$440
Lord's Dottie of Tillybarden	415

Southern Wisconsin Guernsey Sale

The Southern Wisconsin Guernsey breeders held their second semi-annual sale at Ft. Atkinson, Wis., June 7. The 67 animals sold brought $15,045, just over a $224 average, with $460 the top price. L. G. Johnson paid this for Hambro's Busy Rose, a seven-year-old daughter of Langwater Hambro, with a 460-lb. two-year-old record. She was consigned by Ralph Tratt.

Mack, Love, and Benjamin did the selling with Sale Manager J. H. Murphy in the box.

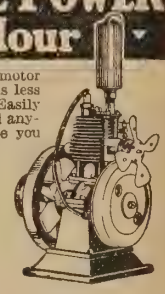
The following list includes those animals selling for $300 or more:

Mrs. H. A. Main, Wisconsin	
Comfort of Prospect	$390
W. D. James, Wisconsin	
Snowdown's Beauty of Prospect	$325
Bonnie of Koshkonong Place	400
Dearie of Koshkonong Place	355
Dearie of Koshkonong Place 2d	355
Gladys' Linda	300
W. L. Elphick, Wisconsin	
Deasie's May Laurel	$400
Anne E. Tieken, Wisconsin	
Cooper's Paula	$400
L. G. Johnson, Wisconsin	
Imp. Brunette of the Haut Pave	$305
Hambro's Busy Rose	460

Cut Down Your Feed Expense

Grinding Grain and Forage SAVES ONE-FIFTH OF FEED. Stock eat every particle of ground feed, and get more nourishment. "Grind Feed, and Watch Your Profits Grow."

THE "JAY BEE"



FEED MILL

"The One With the Trouble Left Out." No Knives, No Buhrs, No Grinding Plates "THE HAMMERS DO THE WORK."

Powerful revolving hammers literally pulverize the feed to any desired fineness. Remark of all who investigate. **Only quick change, four cutting edge, double hinge swing hammer feed mill on market.** Large capacity—durable—Stones, Nuts, Bolts, etc., do no harm. Hammers quickly changed without use of tool. **Grinds anything grindable**—all Grains, all kinds Hay, Snap Corn, Corn Stalks, Corn Cobs, Sorghum, Kaffir Corn, Bundled Cane—all kinds products. **Dairymen, feeders and millers cannot afford to be without it.** Popular size mill especially adapted to Fordson Tractor, or tractors of this class. **Dealers and distributors wanted. Write for facts.**

PORTABLE POWER At 2¢ An Hour

HERE it is! A light motor for heavy duty. Weighs less than 60 pounds. Easily carried. Can be placed anywhere. Gives you power where you want it and when you want it. Operates cream separators, churns, pumps, washing machines sprayers, cutters, grind stones, and other machines requiring up to one horse power.

Rollaway Commercial Motor

Weighs less than 60 lbs. Size 15x10-x12 in. Furnished with fan guard.

High Speed. Strong. Compact. Durable. Designed to stand hard service. Will last years with proper care. Runs day after day at average cost of only 2c an hour. Air cooled. Cannot freeze. Nothing like it! Cannot be excelled for utility, economy or service. Positive lubricating system. Dual ignition—dry battery for starting, high tension magneto for spark. Shipped completely assembled ready to place and run. Price only $60. Buy direct from factory and avoid paying numerous profits.

Wounds Cuts Ringworm Scab

Live stock men fear wounds or cuts on an animal. They know that infection usually follows and death often results. B-K is a concentrated, pure sodium hypochlorite such as is used and endorsed by leading veterinarians, physicians and breeders. It kills the infection germs; cleanses, soothes and heals the tissues.

B-K Bacillus Kill

is not a poison, acid or coal tar product. Clear and clean as water, it kills the infection germs without pain or discomfort to the animal or burning of tissues.

Proof That Proves

A B-K user in Oso, Washington, says regarding Ringworm:

"We bought a gallon of B-K and took a chunk of gunny sack and went after it with B-K. In three weeks there was not a sign of it left and there has not been a case since. Forget that iodine stuff. It's as far behind the times as wintering cattle on oat straw."

Keep B-K constantly at hand in the stable, milk-house and kitchen. Wherever germs lurk it does its work. Money back if you are not satisfied.

At your dealers in all size bottles.

Feeding Phosphorus for Milk

(Continued from page 909)

the ordinary rations are more likely to be deficient in one or both the principal bone building elements than in any other constituent."

In a typical experiment, described by Professor Meigs, an animal would receive daily for 60 days before calving 3 lbs. of a grain mixture made up of 45 lbs. corn and cob meal, 36 lbs. wheat bran, 18 lbs. cottonseed meal, and one pound salt. She also received four pounds of alfalfa hay and 30 lbs. of corn silage daily. The next year she would receive during a corresponding period the same average daily quantities of the same feed, but instead of receiving equal amounts of all the feeds every day she would receive on one day 8 lbs. of alfalfa hay and 30 lbs. of corn silage, and the next day 6 lbs. of grain with sodium phosphate added to it, and 30 lbs. of corn silage. The first procedure is spoken of as "control feeding", the second as "alternated feeding with phosphate".

A study of the tables showing increased milk yields under this phosphate feeding is very interesting. There was a notable milk increase in every case, the increase being most marked with animals that had been on standard feeding as compared with those which had been on test, and therefore special feeding for the past lactation periods. With some of the animals there was also a large increase in fat yield.

Eight tables show the results of the experiments in detail, accompanied by a brief history of each animal used, and an interpretation of the results. Table No. 8, which is the summary, is here shown in full:

Table 8—Expected and Actual 30-day Milk Yields of Cows from the General Herd After Alternated Phosphate Feeding; Actual Yields After Control Feeding.

No. of animal	Actual milk yield after control rations	Expected milk yield after alternated rations with phosphate	Actual milk yield after alternated rations with phosphate
	lbs.	lbs.	lbs.
17	847	847	858
49	831	565	953
50	995	995	972
54	669	599	1,027
63	422	495	1,018
71	632	739	1,121
81	685	753	936
Total	5,081	4,993	6,885

The actual yields after the alternated feeding with phosphate average 37.9 per cent more than the expected.

Mention was made in the preliminary article in Hoard's Dairyman of a year ago of the experiments in character and kind of proteins fed, as influencing milk yield during lactation period. No mention is made of this in the bulletin here briefly reviewed. It is understood that there will be a subsequent publication dealing with this topic.

The bulletin herein referred to is No. 945, a contribution from the Bureau of Animal Industry. It should be read and studied by every close student of feeding for milk production.

"Tillage is manure," according to an old English proverb. Certain it is that both make crops grow.

The tire that walks away with the load

The one quality a truck tire *must* have is ability to get traction.

Mileage is important and resiliency desirable, but unless the tires are able to dig in their toes and push when the engine's power is delivered to the wheels, they might as well not be on the truck.

Few trucks are operated under ideal conditions; in sand, in snow, in mud or on wet, slippery asphalt, you've got to have something on the wheels more efficient than smooth bands of solid rubber.

Solid tires are becoming obsolete. Big pneumatics are expensive and undependable. There is only one tire that in all kinds of weather and over all kinds of roads can carry the truck wherever the driver wants it to go, and do it at a lower cost per mile than either the plain solid or the big pneumatic.

That tire is the Caterpillar. It is made in sizes suitable for trucks of every type and weight.

"My Perfection has cost me less for repairs than any other tool on my farm. As an investment it paid 100% within a year and I know that my cows are always milked clean." —W. H. MEAD.

The Most Economical Farm Machine

IT is poor economy to do work by hand that can be better done with machinery.

Feed and labor costs constitute the bulk of dairy production expense. While you cannot materially reduce feed costs and maintain maximum dairy production, you can reduce the expense of milking to a fraction of your present cost when you milk with a Perfection Milker.

Hired help is expensive and hard to get when there is hand milking to be done. And the high cost of help for hand milking adds nothing to the value of the product.

Why cling to the old fashioned and more expensive method of hand milking when the Perfection makes it possible for you to spend more of your time at other profitable work.

At an operating cost of but a few cents a day one man with Perfection saves you the time and wages of two hand milkers.

Investigate Its Economy

Familiarize yourself with the economy of a Perfection Milker. Send today for your free copy of "What the Dairyman Wants to Know." Why milk by hand? Perfection milks more economically.

Association Notes

Southern Berkshire, Massachusetts:—There are at present 191 pure-bred cows and 263 grades in the association. Of the pure-breds, 19.9% made the 40-lb. list and of the grades, 19.8 per cent made the list. The high cow's record was probably due to an increase in grain ration. Nine cows were sold as boarders. One member has installed a milking machine. The May price for market milk has not yet been determined on account of the members getting their milk checks under the Dairymen's League plan. Milk retailed for 12c per quart.

Bonner County, Idaho:—One hundred acres of sunflowers have been planted the first year. During May, market milk sold for $2.75 per cwt. The creamery paid 30c per pound for fat. Milk retailed for 10c per quart and butter for 31c per pound. Bran sold for $28 per ton; corn, $40; oats, $40; oil meal, $80; pasture, $3.

Salem County, New Jersey:—Among the several bulls recently purchased by association members, Mr. J. Powell purchased King Pontiac Beets Alcartra 2nd, a son of King Pontiac Beets Alcartra and out of Duchess Zanca Beets with a record of 31.55 lbs. butter and 537.3 lbs. milk in 7 days. Of the 41 cows in the milking herd of Chas. Hires, 19 produced from 40 to 71.4 lbs. of fat in May. All milk was cut 1¾c per quart.

Tillamook, Oregon:—Eight unprofitable cows were disposed of and one pure-bred bull bought. A member's barn is being remodeled and enlarged, making it one of the best dairy barns in the county. Thirty-eight members of the association cool their milk by running water and of the ten not having running water, three have tanks.

Jamestown, North Dakota:—One man with a herd of pure-bred Holsteins raised his milk production nearly one-third by adding oil meal and bran to his ration. A movement has been started to bring in several carloads of good grade heifers. During May, market milk testing 3.5 per cent sold for $2.50 per cwt. The creamery paid 30c per pound for fat. Milk retailed for 10 and 12c per quart. Oats sold for 25c per bushel; barley, 35c; oil meal, $60 per ton.

Blue Earth County, Minnesota:—The value of good dairy cows has been demonstrated here and, as the result, two carloads of high grade Holsteins were placed around Amboy. Several pure-bred females were purchased, one a 26-lb. cow and another a 23-lb. cow. Several herds are on long-time test and some members have completed 7-day records. During May, market milk testing 3.5 per cent sold for $2.25 per cwt. The creamery paid 43c per pound for fat. Milk retailed for 10c per quart; but-

"PELOUZE" Dairy Scales

Three Sizes: 40, 60 and 120 lbs. by Tenths of a Pound.

Guaranteed Accurate

Made to comply with Departments of Weights and Measures. Large Circular Dial, with distinct, black figures and graduations. Patented adjustable hand for obtaining the tare weight of empty pail.

Order direct or through any leading Dairy Supply house. Specify "Pelouze."

ter for 34c per pound, and cheese for 30c. Bran sold for $20 per ton; silage, $6; clover hay, $15; alfalfa, $18; oil meal, $2.50 per cwt.; oats, 35c per bushel; corn, 42c.

Wausau—Marathon, Wisconsin:—Fifteen pure-bred cows were sold through public sale. Twelve females and 4 pure-bred bulls were purchased. The high herd has this month made the highest average for two months since the association started two years ago. The owner was induced to start A. R. testing. After this was done and better feeding instituted, production of this herd almost doubled. The herd returned $1.95 for each dollar's worth of feed consumed during April. During May, market milk testing 4 per cent sold for $1.30 per cwt. The creamery paid 33c per pound for fat and the cheese factory 32c. Milk retailed for 10c per quart; butter, 34c per pound; and cheese 22c.

Allenton—Kohlsville, Wisconsin:—Forty-six cows made over 50 lbs. butterfat and 12 over 60 lbs. for this month. Twelve grade Holstein cows and 10 grade Holstein heifers sold for a total of $2,187 in this association during this month. Members are all glad to learn we have second highest average of butterfat in Wisconsin associations and have only been in operation for two years. All herds are now on pasture.

Monroe Co-operative, Wisconsin:—This association has 100 per cent pure-bred sires. Some groups of farmers are buying feed co-operatively. During May market milk testing 4 per cent sold for $2.05 per cwt.

Jo Daviess No. 2, Illinois:—Members are taking a keen interest in better dairy cows. It has always been hogs and corn with a few cows as a side line, but it will soon be reversed. A pure-bred bull is used on all herds but two at the present time. Market milk sold for $1.80 per cwt. with 4c per point being paid for each point above the required test. Feeds sold as follows: corn, $1.75 per cwt.; oats, $1.75; bran, $1.10; oil meal, $2.50; cottonseed meal, $2.30; alfalfa, $15—$18; clover, $15; timothy, $15.

Tri-County, Illinois:—One member improved his herd by disposing of one unprofitable cow and purchasing two pure-bred Holstein cows and a pure-bred bull calf. By a tuberculin test made the first part of May, the herds belonging to the Illinois School for Deaf, the Jacksonville State Hospital, and Mrs. J. A. Taylor are free from tuberculosis. During May market milk sold for $2.08 per cwt. Milk retailed for 11c—14c per quart and butter, 32c per pound.

Macoupin County, Illinois:—Three unprofitable cows were sold and two pure-breds purchased. The average feed cost per hundred pounds of milk produced by members of the association was 78c. During May, market milk testing 3.5 per cent sold for $1.89 per cwt. Corn cost 40—70c per bushel; oats, 45c; bran, $1.25 per cwt.; cottonseed meal, $1.90; linseed meal, $2.60; silage, $6 per ton; pasture, $3.

First Rock Island County, Illinois:—Seven unprofitable cows were sold. No feed was purchased. We use as much home-grown feed as possible with cottonseed and oil meal. One old bull was sold for beef. During May market milk testing 3 per cent sold for $2.12—$4.70 per cwt. The creamery paid 28c per pound for fat. Milk retailed for 12c per quart; butter, 30c per pound; and cheese, 45c.

Ringoes, New Jersey:—A good example of what a good herd sire can do in one generation is shown in the herd of J. F. Lambert. Pabst Johanna Segis has three two-year-old heifers and a three-year-old which have all completed seven-day records from 21 lbs. butter, 523 lbs. milk, to 17 lbs. butter, 407 lbs. milk, and are equalling the daily production of their dams in the same stable. During the month, two pure-bred cows were purchased and several grades disposed of. Market milk testing 3 per cent sold for $1.89 per cwt. Milk retailed for 11c per quart and butter for 38c per pound.

Southwest, Virginia:—One unprofitable cow was sold and four pure-bred Jerseys were bought. The creamery paid 25c per pound for fat. Milk retailed for 14c per quart and butter for 35c per pound. Silage sold for $8 per ton; ready mixed grains, $60; cottonseed meal, $40.

Richfield, Wisconsin:—Five cows were sent to the block and 10 were sold to outside buyers for breeding purposes. Testers of Washington County organized and are going to push testing work more systematically. A. R. House was elected president; Martin Land, vice-president; and L. M. Henderson, secretary and treasurer. During May market milk testing 4 per cent sold for $2.10 per cwt. The condensery paid 57c per pound for fat; the creamery, 56c, and the cheese factory, 38c. Milk retailed for 10c per quart and butter for 35c per pound.

Riverside County, California:—Meetings were held in Riverside and San Jacinto, May 17 and 18 on Feeds and Feeding, with Professor E. O. Voorhies of the University of California as the principal speaker. F. H. Scribner was present at the San Jacinto meeting and spoke briefly on feeding experiences. At a general meeting in Hemet on the evening of the 17th, agitation was started toward bringing in more pure-bred cattle to be placed on the fruit farms in that section. It is anticipated that the valley will be practically a one-breed valley and tuberculosis free.

Money spent on concrete farm improvements is well invested; it's always there; it adds to the value of your farm. Build with Lehigh—the cement that you know is right. There's a Lehigh dealer near you; look for the big blue and white Lehigh sign.

DAIRY MARKET NEWS

Country Cheese Markets Active

(Report by U. S. Bureau of Markets.)

While somewhat irregular, trading in cheese markets was very active during the week ending June 11. The break in prices on Wisconsin cheese boards, which occurred June 6, was somewhat of a surprise to many dealers who had figured that the advances of the previous week would hold.

At Wisconsin primary markets there was more activity than at any other time so far this year. Buying for storage did not assume important proportions, but numerous inquiries indicated an active interest. Quality of the current make was reported satisfactory. Reports also indicate that production is close to the peak, as receipts of milk at some factories have fallen off recently. Primary market dealers look for a good volume of business from now on unless something happens to unsettle the markets.

Reports from wholesale distributing markets differ somewhat. The result of the break in Wisconsin country prices was that some dealers who were buying under contract cancelled their orders and bought from brokers who could offer them better prices temporarily than their contract prices. Boston was the one market where wholesale prices showed again. Prices were unchanged throughout the week at New York and Philadelphia, and but slight changes occurred at Chicago. Wisconsin prices were directly affected by declines on the cheese board Monday, although the price tendency was upward toward the latter part of the week.

The average wholesale prices on American cheese (style Twins) for the week ending June 11, 1921, and for the corresponding week a year ago were as follows:

	Week ending June 11 1921	1920
	Cts.	Cts.
New York	16.0	28.5
Chicago	14.5	25.5
Boston	16.2	31.0
San Francisco	15.5	27.1
Wisconsin	13.7	24.7

The receipts of cheese at these markets was 5,334,145 lbs. as compared with 4,207,372 lbs. a year ago and 4,707,288 lbs. a week ago.

Butter Prices Decline

(Report by U. S. Bureau of Markets.)

During the week ending June 11 butter markets were exceptionally strong even for the early part of June when firmer markets and good trading are usual. Buying both for storage and for immediate needs was very active until Thursday when a reaction set in causing weakness and a set-back in prices for the rest of the week. As prices had made an advance of 1c to 1½c on top grades, and 2c to 3c on undergrades, this decline did not wipe out the gain entirely.

Receipts for the week were materially heavier than for the previous week and for the same period last year, but there was a shortage rather than a surplus most of the time. Demand was chiefly for the fancy long lines of creamery and for fine centralized cars.

The average wholesale prices on 92-score butter at five of the principal markets for the week ending June 11, 1921, and the corresponding week a year ago were as follows:

	Week ending June 11 1921	1920
	Cts.	Cts.
New York	31.9	56.5
Chicago	30.7	54.0
Philadelphia	32.5	57.0
Boston	32.6	56.6
San Francisco	33.4	52.5

The receipts of butter at these markets were 18,543,918 lbs. as compared with 15,419,704 lbs. a year ago and 15,962,655 lbs. a week ago.

New York Butter Market

NEW YORK CITY, JUNE 14—There was a halt in the advance of butter prices on Thursday of last week and a temporary decline of values materialized on Friday and Saturday. That was due to the withdrawal of the speculators who had been operating very actively for several days. There was a feeling among those operators that values had reached a point too high for the safe storing of butter. Following the lead of the speculators, jobbers and retailers ceased purchasing for about two days with the result that stocks began to accumulate to some extent. However, it was apparent that other markets were not taking the situation very seriously, hence active buying again started at the opening of this week and the market has more than recovered what it lost in price values last week.

Figures which recently became available throw much light on this year's general conditions. On May 1, stocks of butter in storage and warehouses throughout the country aggregated 7,494,000 pounds. On June 1, those stocks had increased to 21,500,000 pounds, a gain for the month of fully 14 million pounds. In comparison, on May 1, 1920, there were 7,554,000 pounds in storages, etc., while one month later that had been increased to 12,872,000 pounds, or a gain of only 5,318,000 pounds. Those figures show clearly that speculative operators feel it to be much safer to store butter at present prices than at the prices of one year ago. Butter in storage in New York refrigerators on June 1 aggregated 6,796,829 pounds as compared to 5,316,263 pounds of one year ago. It is true undoubtedly that the favorable season for production has much to do with the increase in stored butter. Not only has the favorable season been conducive to quantity production but it has also favored high quality production, thereby furnishing much greater quantities of butter of such quality that it can be safely stored.

Consumptive demand is falling off to some extent as is usual at this season of the year. That is the result of warm weather which makes living in the large city almost unbearable. At such times city dwellers, who can afford it, move their families to the country thereby reducing the consumption of all food products. However, consumption of butter, even now, is greatly above normal because of

the fact that consumers in moderate circumstances are buying it freely now that the retail price is at a reasonable level. Speculators are banking on a great consumption of butter throughout the year and are therefore buying more freely than ever before.

Last week opened with prices on an upward trend. Values had been increasing ½@1c each day for several days and continued to do so until Thursday when the top price of 32½c which became established on Wednesday remained unchanged. There was little activity on that day and on Friday prices declined ½c. There was a similar decline on Saturday, but on Monday of this week there was a recovery of ½c and that was followed by an advance of 1c today. Free buying is the order of the day at present and it is very probable that prices will go yet higher although receivers, in general, feel that further advances will result in a curtailment of activity with a resultant slump. Established quotations today are: Extras (92 score), 32½@33c; higher scoring than extras (93 score or higher), 33½@34c; firsts (90—91 score), 31@32c; firsts (88—89 score), 29@30½c; and seconds (83—87 score), 26@28c.

Ice Cream Production

The 1920 census of manufacturers shows that there were 3,476 establishments engaged in the manufacture of ice cream in 1919, the value of the product reported being $189,414,000. In 1914, reports were received from 2,437 establishments with products valued at $55,983,000.

Pennsylvania is credited with the largest value of ice cream products, her 476 establishments producing nearly 30 million dollars' worth of ice cream in 1919. New York had 516 ice cream establishments producing over 25 million dollars' worth of products. Next in order comes Illinois, Ohio, Massachusetts, New Jersey, and California.

Folly Farm Dispersion

Folly Farm owned by R. H. Donnelley has long had one of the best Guernsey herds of Illinois, and its dispersion at Fond du Lac, Wis., June 4, was an event of more than ordinary interest in Guernsey circles.

The 38 animals included in the herd brought an average of $400, with three selling for $1000 or more. St. Austell Daybreak, a 4-year-old daughter of Don Diavolo of Linda Vista, now on A. R. test, topped the sale at $1700 going to Jay B. Deutsch of Michigan.

F. J. Reuping of Wisconsin purchased the second animal in the price list for $1400. This was a four-year-old daughter of Langwater Pencoyd, with a record of 593.91 lbs. fat in DD.

Chas. L. Hill managed the sale.

The following list includes those animals selling for $450 or over:

F. J. Rueping, Wisconsin	
Mavourneen of Pencoyd	$1400
Folly Laura	500
Fillmore's Topsy	535
Folly Suzette	550
Folly Honoria	500
A. L. Sheldon, Minnesota	
Folly Dido	$1000
Red Moose Farm, Illinois	
Folly Beatrix	$450
Jay B. Deutsch, Michigan	
St. Austell Daybreak	$1700
Folly Daisy	675
B. F. Sheridan, Wisconsin	
Doris of Sarnia	$450
Mt. Zion Ranch, Wisconsin	
Bella's Golden Lassie	$610

Sharples Standard of the Dairy

...ce." ...out of ... skeptical about machines, when forced to use one because of the shortage of help during the war, became enthusiasts. They found that their boys could do the milking during busy seasons and thus save keeping an extra hired man. Now that labor is more plentiful they do not care to change back to the hand method of milking.

One of our readers ... owned to the ...

"Boys of Twelve and Fifteen do the Milking

—The Machine is Saving me $50 a Month and the Board of One Man"

IF you still milk by hand read the letters (from which the above comment was taken) in the April issue of The Dairy Farmer—then investigate the Sharples Milker. Find out how you can make "milking time" a shorter, more agreeable, more productive and more profitable than ever before. Find out why the percentage of America's 24,000,000 dairy cows being milked the Sharples way is increasing daily.

The Sharples is made in two types. The Sharples Master Milker (for large or small dairies) is now in satisfactory use on over one million cows and is to be found in nearly every country in the world. Our Moto Milker is an electric, portable milker made especially for six to twenty cow dairies that have electricity. No installation is necessary—simply wheel it in the barn and milk. It will run from a farm lighting plant. Both machines have the same suckling action on the teats and the intermittent squeezing by Compressed Air (patented). A Sharples will cut your milking costs and increase your profits from the start. Let us send our free descriptive booklet.

THE SHARPLES MILKER COMPANY
WEST CHESTER, PA.
Chicago San Francisco Toronto

SHARPLES MILKERS

No other milker has a positive squeeze. No other milker even squeezes the teats out of round. No other milker uses compressed air. Sharples patents protect this big feature absolutely.

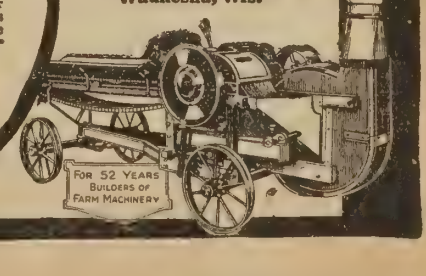
Most cows give down more milk to the gentle, comfortable Sharples suckling action than they do to hand milking. They like it and it frequently increases the milk yield

SAFETY

No Stripped Gears—Reverses Under Full Load at Top Speed

Load the Rowell to full capacity, run it at top speed—throw the reverse lever—it *instantly reverses*, No danger of stripping gears. This device may save a costly breakdown. You get it on the Rowell. The automatic safety release on the pulley and fly wheel allows the cylinder to stop before foreign substances can get to the blower fan. No danger of accidents.

ROWELL SAFETY-AUTOMATIC



The Safest Silo Filler. All moving parts guarded. Rigid construction keeps every part in line. Cutting cylinder with three or four knives works just like a lawn mower and is as safe to use.

The Rowell makes the best ensilage. You harvest the corn when it is ripe. No danger of damage by frost. You never have to wait if you *own a Rowell*—you're always next.

Send us the size and height of your silo and the power you have, and we will quote you on the Rowell you need. *Write for booklet.*

Waukesha, Wis.

HOARDS DAIRYMAN JUNIORS

A DEPARTMENT FOR THE DAIRY FARM BOY

Keeping Pace With the Season

Spring is fast slipping into summer. Indeed we are almost inclined to think that we are in the midst of summer, so rapidly is everything growing. There is an old saying in which there is much wisdom and good advice for each of you Juniors which says, "make hay while the sun shines", meaning of course that one should not allow present opportunities to slip by without being able to give a good account of them.

Now and for the next few months is the time for each of Hoard's Dairyman Juniors to give a good account of his time. Your calf, pig, lamb, poultry, acre of corn or garden will be a fair representative of the work you do this summer. No matter how good the start you have made, the results will not be good unless you continue to do your best. Whether you are working with plants or animals, keep them growing as fast as possible, and only care of the right kind will do the job from now on. Let it be said of you this fall when the growing season is over, "he did his best". And we are certain that if you do your best, you will have something worth while to your credit. Plan right now, if you have not already done so, to have something to exhibit at the fairs this fall when they open. It isn't so much the prize which you may win as it is the fact that you will be doing something really worth while and that you may be the cause of others doing things which are good.

It is easy to begin to slip from the good which one sets out to do and we know that it takes a pretty strong will to bring work of some kinds to a successful close. But it can be done and if you will take the trouble to look up the life of some one that has been considered successful, you will find that he has been a hard working, persevering fellow. Success doesn't come without effort and we don't think there is very much to what many people call good luck. Usually it is a case of good, honest effort instead. And then there is joy in doing things and it grows as results are being obtained. The fellow who watches his calf grow into a fine cow when he has been doing the work himself is certainly rewarded from the pleasure this gives him to say nothing about being the proud owner.

In the past, Hoard's Dairyman Juniors have been invited to write their experiences in the form of stories to be used from time to time on the Junior page. Some have been very well written indeed. But our complaint is that there have not been enough of them from so large an organization as our Juniors have. Here is something for you all to keep in mind through the summer. When schools open up again next fall and we all get back to the habit of school work, we expect to invite the Juniors to again write stories and this time there will be prizes offered for the best ones. So whenever you think of anything this summer that you feel will be of interest to mention in the story you will write, it might be a very good plan for you to make note of it and then when the time comes for you to write you will have it to use. We want every Junior to be successful no matter where he is living and what he is doing, and you will find that there is only one way to success and that is persistence working hand in hand with patience.

TWO GOOD PRODUCTS OF BEECH WOOD STOCK FARM, NEW YORK; GRACE WAGNER, AGED 5, AND COLANTHA DEKOL BLOSSOM

Exercise for the Calf

Muscle and bone of good quality cannot develop from inaction. Growing animals of all kinds must have exercise in order to build up strong, vigorous constitutions. Those of us who are raising calves should be very much concerned about providing a place for daily exercise if we expect them to develop as we would like to have them. It is but a natural law to which we should conform. One may think that his calf is doing very well even though it is quite closely confined, but on the other hand how much better would it be if it had some freedom to do as it pleases. A calf in the pasture usually gets all of the action it cares to have but that is not a good argument for allowing young calves to be brought up in the pasture. There are too many other evils attached to this way of bringing them up. Young calves allowed the freedom of a pasture to the extent that they are kept there all of the time will not make as rapid gains as those which are barn fed. There are some sensible reasons back of this statement, too, which I am sure those of us who have had experience will appreciate. First, we are not so liable to be regular in attending to them; and, second, to be subjected to the hot summer weather and to the torture of flies is not a good thing for them. But while we contend that the stable is the best place to raise calves, everything for the welfare of the calves being considered, we also argue that there must be some provision made to give them an opportunity to run and play. Did you ever see calves at their play? If you haven't you have not been a very good student of them. How they like to run and kick and chase each other about. This is how they like to take their exercise.

The worst thing that we can imagine is to keep a young calf tied up day after day in some dark corner of the stable, where it sees no other living thing excepting the one who feeds it. This we will label cruelty and we trust that there is not a single Hoard's Dairyman Junior who is doing this. It is all wrong and Nature never intended anything like this to be inflicted upon the young of animals. While this is the worst that we can imagine, we think it is also bad to keep a calf confined to a small stall in which he can barely turn about. A big, bright, airy pen is better, but even this does not allow of sufficient exercise. In addition, there should be a runway outside at their disposal especially on bright, fair days and if this cannot be had, then we would suggest that they be given the freedom of the stable during the day time. And if this can't be done, then we have something else to offer.

Since you are planning to exhibit your calf this fall at some of the fairs or shows you will want to teach it to lead. This is one of the many features you will want to look after in its training if you expect it to act to good advantage when the judge is passing on it. Now, then, if you teach it to lead well, you can at least exercise it each day by leading it about the yard and you will find that you will have about as much fun as the calf does. Anyway we know that it is one of the best brands of medicine you can give your calf for keeping it in good health. Good, wholesome feed and plenty of it together with exercise daily and a bright, airy, and roomy place in the stable to live in is about the best combination that we know of to make a calf happy and contented. Happy and contented calves develop vigorous constitutions and make good cows.

Why We Go to School

Some time ago, I asked a number of boys why they were going to school. Rather a senseless question some of you may think. But from the answers that were given, I am inclined to think it is a very sensible one for us to consider. Although I cannot repeat all of the answers, I will give some of them to prove that we are not all keenly aware of the real reasons why we go to school. They ran somewhat like this:

School is a good place to make us work; it keeps us out of mischief; we learn things there that can't be learned in any other way; it will make it easier for us to earn a living; we won't have to work so hard when we get to be men. While most of their answers expressed an element of truth, still we think that they were quite far from the point.

Certainly school is a place where we expect to learn and may be it will fit us to earn a living much easier and in a pleasanter way, and quite as certain it will not let us off easier when we get to be men. The more education one has, the more he should be capable of doing and the greater the service he can render. The school helps us to understand our relationships that daily surround us and it also helps us to find the things that we want to do when we are through. It makes us form good habits of thinking and doing and after all these are the really worth while things to learn. Whether or not we realize it, the privilege of having a good school to attend is perhaps the greatest opportunity that every boy and girl has and we would like to see them measuring up to it. The time will come when those of you who do not appreciate this great advantage will say, "I wish that I had gone to school when I had the chance and that I had taken more interest while I was there". There is never any time quite as good as the present, so we hope that all of the Juniors are enjoying their school days and that they are planning on getting just as much school education as they can. It is the best investment that can be made at this time of your lives, and it is just as much of an honor to be a good student today as it ever was.

What Is Buckwheat?

How many of you Juniors realize what buckwheat is as you sit down to an appetizing breakfast consisting of buckwheat cakes and maple syrup? To be sure there must have been flour from which they were made and it is not the flour used in making bread. Buckwheat is a plant but quite different from the wheat plant that furnishes the flour from which most of the bread is made. It is a member of a plant family to which some of our common weeds belong, such as sheep sorrel and the yellow dock. The name of this family is the Polygonaceae. While buckwheat is commonly grown as a grain crop and is sometimes called a cereal grain, we should know that it is not a cereal in the true sense of that term. Only those grains which belong to the Gramineae or grass family of plants are true cereals. Hence wheat, oats, barley, rye, rice, and corn are the real cereals. But because buckwheat is used to make flour, it also is referred to as a cereal.

Buckwheat is an interesting plant for several reasons. Although the production of it is not very large in the United States, still it has a very important place in some sections of the country. It is interesting to know the habits of different kinds of plants, and it is almost necessary to know them if we are going to grow the best kinds of crops. Some crops can be grown under quite different conditions than others. For example, alfalfa must have a fertile, well limed, and well drained soil to do its best. While this condition will give the best results with most any crop, it is not nearly as necessary for many as it is for alfalfa. Buckwheat is one of those plants that is not very particular about the kind of soil it grows upon. Here, again, we are able to see the workings of an all wise Nature in providing us with a series of crops suitable for all kinds of soil conditions.

If there is any one crop that will do well on an acid or sour soil, it is buckwheat. It will occupy to good advantage the poorest soils of the farm and it usually gives a fair return. While this crop is generally grown as a grain crop, still it has other uses. On account of being able to seed it late in the season, it may be used to good advantage to smother out weeds where soils are badly infested with them. A good thing to do in such cases is to keep the land cultivated until the middle or third week in June so as not to allow any of the weeds to grow. This is called fallowing the soil. Then when the buckwheat is seeded, it will grow so rapidly and vigorously that it smothers out the few weeds that try to come up and in this way we are able to get rid of them by means of this crop.

While there are several kinds of buckwheat, the number of useful varieties is comparatively limited. What is known as Japanese buckwheat is perhaps the leading variety. It is the largest seeded of all varieties and ranges in color from a dark brown to almost black. The next important

one is called Silverhull because its hull has a silvery gray appearance. Compared to the first variety, it is smaller seeded and is inclined to weigh more per bushel than the Japanese. The crop also matures earlier. Then there is a variety that is intermediate between these two known as the Common Gray. It is quite difficult to find samples of seed that are entirely pure of any of these varieties. There are several reasons for this. First of all, the growers do not sow pure seed; secondly, the plant breeders have not improved this crop very much as yet; thirdly, the varieties cross very freely. So for these reasons pure seed is rather difficult to find.

But have you ever seen buckwheat growing? Here, again, it is quite different from wheat. In fact, buckwheat means beech wheat on account of the resemblance of the seeds to those of the beech tree. The seeds are three-sided and three-edged so that they look somewhat pyramidal in shape. The flowers are white to pink in color and they furnish a great deal of nectar for the bees and this is the reason why we are able to speak of buckwheat honey. When the plants are in full blossom, they are visited freely by the bees and so it may be that the majority of honey made for a certain length of time comes from the buckwheat flowers and so has a flavor peculiar to buckwheat. The plants are blossoming for quite a long time, a habit which makes it a good bee pasture plant.

Now suppose we were to seed a piece of land to buckwheat, I wonder if many of us would know much about what to do and when to do it. It might be well for us to consider some of the things we would have to do if we were growing a crop. We do not have to be in a hurry to seed it because early seedings will not amount to much. Buckwheat is very sensitive to frosts so we must wait until that danger is passed. It doesn't take very long for it to make its full growth, so all we must look out for is to give it sufficient time to make its growth and ripen. Growers usually consider any time in June up to about the first week of July as the best time to seed. Somewhere about the middle of June would be the most ideal time. Since buckwheat likes a temperate climate, most of the crop is grown in the states of New York, Pennsylvania, and the New England States. There is little of the crop grown in the south or west of the Mississippi River. Since this crop is not so particular about the kind of soil that it will grow on, it is usually the custom to give the poorest soil of the farm to it where it is grown. And we think that this is quite as it should be, because we should learn to be discriminating in the choice of what we grow.

Now if we continue with the seeding of the field we will learn that buckwheat is very easily seeded, in fact, just the same as any of the other grains. From three to five pecks of seed will be needed and it may be sown with the grain drill or with the broadcast seeder. The seeds will sprout quickly and it is not very long before the field is all green and with the right kind of weather following the crop will make a most rapid development.

If one does not want to thresh the seed, he can plow the entire crop under to furnish organic matter for the soil. This is quite often practiced because it usually is those very soils that are seeded to buckwheat that need organic matter to make them better. But the crop, as said before, is usually grown for seed and the seed is milled into buckwheat flour. When the crop is ripe, it is cut either with a grain binder or a mower and allowed to dry sufficiently in the field so that it can be thrashed directly without having to handle it in the barn or stack. Since the plants are quite juicy at the time the crop is cut, many growers do not have any twine in the binder and so the bundles are not tied. This helps to dry it out faster, but whether one uses twine will depend upon how ripe the crop is at the time he is cutting it. Thrashing is very easily accomplished by means of the regular small grain separator. It is quite possible to produce 25 bushels of seed per acre although an average yield would be about 15 to 18 bushels.

The common use for buckwheat is flour. This is made by a process quite similar to making flour. The hulls must first be removed after which the seed is ground into flour. From 100 lbs. of good buckwheat seed, there should be obtained about 65 lbs. of flour, 20 lbs. of hull, and about 14 lbs. of middlings. The middlings come from the real seed covering just underneath the hull. The hull itself is of little value but sometimes it is mixed with the middlings and the product is known as buckwheat bran. Both are used for stock feed, but the middlings are very much superior to the bran. We hope that this little story will serve to make all the Juniors learn more about this plant, even though it does not rank with more important crops of the farm.

JUNIORS ON DAIRY TOUR

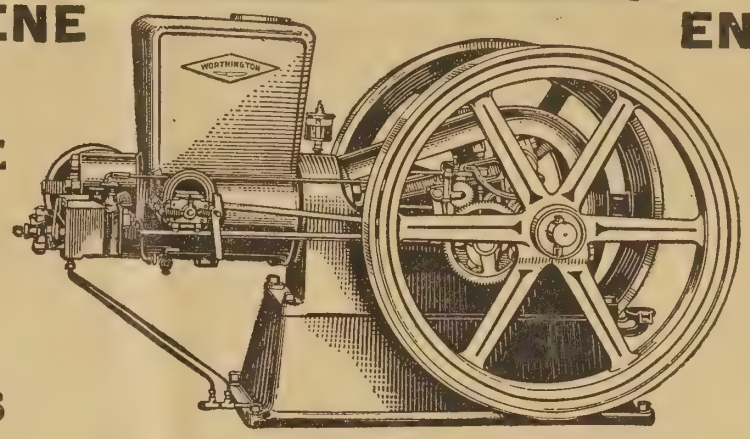
Salem County, New Jersey, has a Junior Dairy Club that made a tour of some of good herds to learn at first hand what good dairy practice consists of and how prosperous breeders are made. There were 44 boys who got a new insight into the possibilities and delights of dairy farming as it should be.

Junior Letters

Hoard's Dairyman Juniors:—We will have a real pig club this year as seven of us are in a sow and litter contest. We have all pure-bred sows. My sow has just six pigs. Another Poland-China in the contest has a litter of ten. We all have Poland-Chinas but two who have Durocs and Chester Whites. I am also raising pure-bred Black Siberian rabbits. I am milking four cows now. They are Jerseys and Brown Swiss. Brown Swiss are easier milkers than Jerseys.

Kansas. Mahlon Beachy.

Hoard's Dairyman Juniors:—I enjoy reading the junior page in Hoard's Dairyman. We have been getting this paper for a long time. I am 11 years old and in the 6th grade in the town school. We have 40 pure-bred Brown Swiss cattle and about 70 sows and small pigs of the Hampshire breed.



We get out of school about the 3d of June.

Wishing all the juniors good luck. If any of the juniors would like to write, my address is R. F. D. No. 1, Hudson, Wis.

Edward Boody.

WORTHINGTON

KEROSENE ENGINES

DEPENDABLE ENGINES

FEED MILLS
PUMP JACKS

1½ to 25 HORSE POWER

STATIONARY AND PORTABLE

THE ENGINE YOU WOULD LIKE TO HAVE AT THE PRICE YOU WANT TO PAY

WORTHINGTON Engines are as staple and dependable as the plow. There is just the right size and type for every need. Easily started in the most severe weather! They operate on the cheapest fuels—the operation being steady and uniform under variable loads. They are the best designed and highest grade farm engines made—Stationary and Portable.

The prices have been scaled down to the very bottom, as we desired to make it an object to you to buy now instead of waiting. You get the benefit of the low prices now and have the engine to use at a time when it is most needed. Big Free Catalog and Prices on Request. Do not miss this opportunity to know more about these engines and the surprisingly low prices! Write today for Catalog L—Send back the Coupon.

STOCK FOR SALE

Holstein heifer and bull calves. Pure-bred, registered and high grade. Splendid individuals and breedings. Delivered to you, $25 and up. Your inquiry will be given our best attention. BROWNCROFT FARMS, McGraw, N. Y. 5*

I have usually 100 head of registered and high grade Holsteins on hand for sale. Also registered and imported Percheron and Belgian horses. RALPH HUDSON, Milton Junction, Wis. 12*

For Sale—At Elmwood Stock Farm, high grade Holstein cows, fresh and springers, by the carload. JOHN MURPHY, Mukwonago, Wis. 3*

"The Willows" offers fifty high grade Holstein cows for sale. S. D. SHAMBEAU, Waupaca, Wis 12*

Serviceable grandsons of Lola Segis Pontiac Homestead for sale, he a 34-lb., 1,000 lb. son of Piebe Laura Ollie Homestead King. Their dams are daughters of Joe Oak De Kol Fobes. Well grown, good individuals. Your choice, $150. R. W. MEAD, Stillwater, Minnesota. 10*

Baby Bulls—Registered Holstein-Friesian by high class sires and heavy producing dams. Price is right. C. S. MULKS & SON, Whitewater, Wisconsin. 3-*

We ship our 7 weeks old Holstein calves subject to inspection c. o. d. for $28.00. Express charges paid. Special price on lots. SPREADING OAK FARM, Whitewater, Wis. 17-tf.

Holstein grade heifer calves, two to four weeks old from tuberculin tested herds. Crated $22. Pure-bred bulls from tested sires $75 and up. Shipped C. O. D. WAUKESHA COUNTY HOLSTEIN BREEDERS' ASS'N., Waukesha, Wisconsin. 20*

Registered Holstein-Friesian heifer calves. $40.00, satisfaction guaranteed. HILLCROFT FARMS, Walton, New York. 21-3

Write to us if you want to buy Holsteins. WISCONSIN LIVE STOCK ADVERTISING CO., Madison, Wisconsin. 22-2

A yearly record son of 37th. Very good individual. Four years old. Price $600. Write BOX 783, care Hoard's Dairyman. 22-2

Federally Accredited Holstein herd for sale. Twenty females. Ten have A. R. O. records. Homestead breeding. Price $5,800. Address BOX 782, care Hoard's Dairyman. 22-2

Holstein Bull—Ready for service, 2 dams average 106 lbs. milk in one day, 40.67 lbs. butter in 7 days. $125 terms. Also two heifer calves. ROY HARRIMAN, Appleton, Wisconsin. 23-4

Bulls for sale by "37th" 1127-lb. sire. From tested and untested dams. PESTER BROS., Whitewater, Wisconsin. 23-6

My entire herd of grade Guernseys for sale. Also a few choice heifer calves at $30.00 delivered. SHADY HILL FARM, Whitewater, Wis. 23*

Guernsey heifer calves. Can ship you 10 at once about 4 weeks old. Calves out of my own herd, so know what I am shipping. $30 each crated. F. O. B. Waukesha. WERN FARMS, Waukesha, Wis. 18*

For bargains on May Rose bulls with type and production, write KUHTZ BROS., Waukesha, Wis. 21*

Guernsey calves six weeks old, $20. F. O. B. Knapp. THOMAS HAGERTY, Knapp, Wisconsin. 2*

Guernsey bulls, also a few females. Send for reduced price list. MATH MICHELS & SONS, Fond du Lac, Wisconsin. 21-*

Carload Guernsey yearling and two-year-old heifers all from high producing cows, price right. WETMORE & O'NEILL, Bridgeport, Wis. 22-3

Guernsey bulls from high record cows at very low prices. Send for list. H. W. GRISWOLD, West Salem, Wisconsin. 23-4

Craigamoor Guernseys—The first daughter of Craigamoor Golden Noble at 2 years and 21 days, carrying calf six months, has completed record of 612 lbs. butterfat, in herd of McGordan of Gordandale. I have young sires very closely related to him which I will sell at prices which cannot be duplicated. GEO. C. COOPER, Superior, Wisconsin.

Serviceable and younger Guernsey bulls. Glenwood's Champion (25 A. R. daughters) and Beauty Eagle (846 lbs. fat) breeding. Bargain prices. LA BELLE KNOLL FARM, Oconomowoc, Wisconsin. 23-tf

For Sale—Registered Guernsey bull 18 months old. Splendid breeding. Price $150. EDWARD R. HALL, R-2, Glenview, Illinois. 23-2

My entire herd of full-blood Jersey cows for sale, not registered. My 32 cows made me 843 pounds of butter during the month of May. 32 cows as good as there are, 15 young heifers, 2 full-blood bulls. Will sell at a sacrifice for $7,000. W. E. JEFFREYS, Rocky Mount, N. C. 23-2

Registered Jersey calves, both sexes. Expressage prepaid. "SCHUTZ," Baileys, Colo. 22-2

Jerseys, bred heifers. Will be fresh in July. Price $160 each. Registered and transferred. Also few choice calves. Noble of Oakland's blood lines. M. A. O'BRIEN, R-1, Reedsville, Wisconsin. 22-3

STOCK BUYER

Registered dairy cattle bought and sold. EDWARD A. WALTER, 111 Monroe St., Chicago. 18*

Will buy for you, dairy cattle of any breed, grades or pure-bred. DAVID W. WILLIAMS, Lake Forest, Illinois. 6*

Save 30 per cent by buying your cattle through J. D. POWERS, Fort Atkinson, Wis. 12*

We buy and sell dairy cattle of all kinds. Car lots of registered and high grade Holsteins a specialty. F. B. GREEN & SONS, Evansville, Wis. 18-*

Registered or Grade dairy cattle selected. W. R. GATES, Fort Atkinson, Wis. 19-*

STOCK WANTED

Wanted—A 30-lb. bull, five or six months old. Will consider only good individual. Send picture and pedigree in first letter if possible. Address BOX 784, care Hoards Dairyman. 22-2

Car or more heavy producing Holsteins. Tuberculin tested. Three to five years. W. N. PENCE, Box 171, El Paso, Texas.

Wanted—Registered Holstein cattle in exchange for 120 acres timberland in Clark County, Wisconsin. Good soil in settled country near Dorchester. GUST H. WEBER, Burnett, Wisconsin.

Wanted—Best registered Holstein bull 10 to 15 months old. $300.00 will buy. BOX 75, Darlington, Wisconsin.

DOGS

Male Collie, fine heeler, 2 years, $25. Male collie Shepherd, 9 months, $20. Male Shepherd, 7 months, $15. Both broke to the heels. JOE TAUBER, Waldo, Wisconsin.

POULTRY

Choice S. C. White Leghorn cockerels, 12 weeks old, from real winter layers, best blood of the breed, $2.50 each; 3 for $6; 6 for $10. MARTIN VOGT, Comstock, Wisconsin.

Baby chicks $8.50 per 100 up. Postpaid. Catalogue free. FARROW-HIRSH CO., Peoria, Illinois. 9-16

Live Broilers now wanted. Highest prices paid for poultry, veal, pigeons, lambs, etc. Quick returns, fair treatment. C. E. MC NEILL & CO., 325 West So. Water St., Chicago, Ill. 17-*

SWINE

Registered Duroc Pigs. $10 each. Write your wants. F. A. LAMB, Cassopolis, Mich. 21-3

April Chester White pigs. $7 each. L. SEXTON, Calderwood, Michigan.

For Sale—Big type Poland China pigs, eight weeks old, sired by Smooth Orange, No. 408079. $10 each. S. O. WEBSTER, R-2, South Haven, Mich. 23-2

MACHINERY

For Sale Cheap—A small lot of standard make Swedish Cream Separators, 400 pounds capacity, $29.00, 500 pounds capacity, $34.00, 700 pounds capacity, $39.00. These are all new machines, wonderful bargains. THOMAS TAFFEE, Box 355, Lansing, Mich. 18*

One Waterloo Boy 12-20 tractor good as new. One Grand Detour Jr. 3-bottom plow, new. Two 16-inch pulverizers new. H. C. KARSTEN, Huntley, Illinois. 10*

Perfection Milker at Bargain. Four single units, pump, tank, gauge, and safety valve, used but a few months, everything in good running order. Price $250. BOX Z, Hutchinson, Minn.

For Sale—A 15 H. P. Horizontal Locomotive Type Kewanee boiler used only six months. Also No. 101 De Laval Clarifier Steam. F. M. BYERS, Midvale Farm, Moline, Illinois. 23-2

Several new U. S. Cream Separators. Price right. THOMAS DORGAN, Springfield, Illinois. 23-3

Alabama—Your Real Opportunity
The "LIME LAND BELT" of the South offers unusual opportunities for the DAIRY and LIVE STOCK farmer.
Montgomery County, Alabama is the only section of the Lime Land Belt that has the wonderful combination of splendid roads, excellent R. R. facilities, stock yards and markets, an abundance of pure water, low tax rate and a great system of Consolidated Rural Schools. You will make good on a Montgomery farm. Write for "A Carpet of Green."
FARM SECTION, Chamber of Commerce, Div. W, Montgomery, Alabama.

Devon Cattle Breeders Form Advanced Registry

At the last meeting of the American Devon Cattle Club, steps were taken toward the formation of an Advanced Registry, in which the milk and fat records of Devon cows will be recorded.

The requirements will be practically the same as those for other dairy breeds and the tests will be conducted under the supervision of an agricultural college or experiment station.

Two cows owned at Roscroft, Massachusetts, are already on test. It is recorded that records have been kept on Devons as early as the seventies when Bright Promise owned by Banker Bros. of Pennsylvania, made 21 pounds of butterfat in a week.

Agricultural Manufactures

During the past five years the United States creameries have decreased 17 per cent in number, while the number of cheese factories have increased 12 per cent and condenseries increased by 111%. These figures are from the report of the census for 1919. In 1914, 4,356 creameries produced 243 million dollars' worth of goods as compared with 3,737 creameries producing 583 million dollars in 1919. The 3,082 cheese factories produced nearly 52 million dollars' worth of cheese in 1914, while 3,530 produced nearly 144 million dollars in 1919. Condenseries increased from 190 in 1914 to 401 in 1919, their product being valued at 69 million dollars in 1914, and at 339 million dollars in 1919.

The following table gives comparative statistics for the various items of manufacture of interest to farmers, the value of products manufactured being given in millions of dollars:

Industry	No. of factories 1919	No. of factories 1914	Value of products in millions of dollars 1919	Value of products in millions of dollars 1914
Agricultural implements	519	601	$ 305	$ 164

Eau Claire, Wis., Guernsey Sale

Members of the Chippewa Valley Guernsey Sales Ass'n., like those in every other similar association, took lower prices at their recent annual sale than a year ago.

The sale, held at Eau Claire, Wis., June 1, brought out an average of $232 with the 41 females averaging $242.

W. E. Harrington, Minnesota, purchased the top priced female for $425. This was a yearling daughter of that good sire, Imp. Clara's Sequel, from the herd of Lloyd Rundell.

Love, Benjamin, and Lemanski did the selling with Fox in the box.

The following list includes those selling for $300 or more:

W. E. Harrington, Minnesota	
Victory of Aurelian Farms	$350
Lila's Myra	300
Patience of Sylvanite	410
Maid's Lily	400
St. Croix Catherine	425
E. Beisecker, Wisconsin	
Buttermaid of Excelsior Farm	$350
G. A. Brunstead, Wisconsin	
Glenwood's Dairymaid's Princess	$350
Earl McRoberts, Wisconsin	
Lady Masher of Tristram Farm	$355
R. Fisher, Canada	
Lily of Elk Meadow	$400
Gaylad's Primrosebud	300
J. G. Owen, Wisconsin	
Molly of City View	$390

One bird man declares that insects make up two-thirds of the food of the birds. Yet some farmers still think that birds are their enemies instead of friends.

BETTY OF LAKE VIEW

Breed Brown Swiss Cattle

They prove their superiority over other breeds when subjected to trying conditions on the farm, by keeping in good flesh and filling the pail while other cows grow thin and reduce their yield. You can prove this to your satisfaction.

BROWN SWISS CATTLE BREEDERS' ASS'N

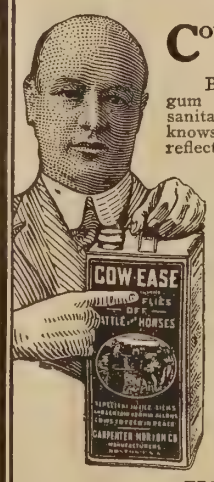
"The Most Profitable Investment I Ever Made"

A PROMINENT dairyman says: "Since installing a Universal Milker in my barn, I have reduced my labor costs two-thirds and the milk flow has been increased enough to more than pay for upkeep and interest on my investment. I consider the Universal the most profitable investment I've ever made for my farm."

The Universal is doing this same thing in thousands of other dairies. It will do it for you.

A postal card will bring complete facts. Write today.



The Universal Milking Machine Company

Dept. A Columbus, Ohio

Branch Offices: Madison, Wis. Syracuse, N. Y.

Universal natural milker

COW-EASE is guaranteed to keep flies off cattle and horses. It is a clean liquid preparation of the right consistency for applying with a sprayer.

Being absolutely harmless, it will not blister the skin nor gum the hair of the animal. Beyond being humane and sanitary it is a profitable investment as well. Every farmer knows what a fly-ridden cow suffers and that suffering is reflected in the quality and quantity of the milk yield.

Insist upon COW-EASE. Try it and prove the claims which I have made.

Ask your dealer for COW-EASE. If he cannot supply you, send me your order per my liberal trial offer below.

M. Elton Voss
Vice-President

CARPENTER-MORTON COMPANY

MIDDLESEX MEADOWS FARM

OFFERS

Two outstanding AYRSHIRE BULL CALVES for sale for immediate shipment

No. 1—MIDDLESEX WHITE CHANCELLOR 25273, born September 17th, 1920.
Sire—Cavalier's Netherall Chancellor 21216, who sired the winning bull calf at this year's National Dairy Show.
Dam—White Heather of Highland 42752, who stood 2nd in the aged cow class at the same show (this year's National) and who has two good Roll of Honor records.

No. 2—MIDDLESEX MANCHESTER, born March 10th, 1921.
Sire—Auchenbrain Toreador (Imp.) 24761, record priced bull of the breed and Grand Champion at Maryland, New York, Connecticut, and New Jersey State Fairs this year.
Dam—Bida Clinton 31489, who has three A. R. records that average 11,000 lbs. of milk, 453 lbs. of fat, 4.17%; and whose two-year-old daughters will have records of over 10,000 lbs. of better than 4.00%.

Both bulls have excellent individuality, and are fit to go into any show ring and hold their own. They should develop into extra good herd sires. Prices reasonable—we **KNOW** you can't get as good as these two for any less money elsewhere.

A. Henry Higginson (Owner). **W. R. COUTTS, (Supt.)**

South Lincoln, Massachusetts

If you are interested in

Economical Production of Highest Grade Milk

You should become acquainted with the ability for such production possessed by

Strathglass Farm Ayrshires

Among several noted bulls in service in the herd now numbering over 200 head are *Penshurst Mischief Maker, son of the World's Record cow for the breed and sired by a son of the cow standing second in the list for both milk and fat,* and others from the heaviest milking and best breeding families.

Sons of these bulls out of R. of M. cows now in offer may be counted on to materially assist in the accomplishment of above mentioned results.

We also have a few heifers of various ages to sell. Tabulated pedigrees and full particulars sent on request.

STRATHGLASS FARM, Hugh J. Chisholm, Owner, Port Chester, N. Y.

We Have For Sale

the well bred Ayrshire bull, Bargenoch "Drexel" (18474) Imported. Bred by John Logan, Bargenoch, Scotland. Born Feb. 2nd, 1919. Color white and red. Sire, Bargenoch Magnificent (9579). Sire of Bargenoch "Royal Champion" sold at Bargenoch sale, 1919, for $7,267.00.

Dam, Bargenoch Victoria (37003). Scotch record: 9,221 lbs. milk, 4.23% fat in 43 weeks; 11,070 lbs. milk, 4.50% fat in 47 weeks.

BARCLAY FARMS, John Cochrane, Manager. ROSEMONT, PENNSYLVANIA

Working Cows in Western Washington

(Continued from page 907)

ding was used for each 100 lbs. But it takes something besides feed, labor, and bedding to produce milk.

Other Costs

Large amounts of capital were invested in buildings, equipment, as well as in the cows themselves. It was necessary to charge interest, taxes, insurance, and depreciation on the herd, buildings, and equipment. Repairs on the barns, silos, milk houses, and on the equipment required to take care of the herd and its products had to be charged also. Cost of keeping the bull, and such expense of veterinarian's fees, medicine, disinfectant costs, cow testing association dues, and similar expenses had to be paid and charged against the business. These charges amounted to $0.576 for each 100 lbs. of milk produced in winter and $0.406 for each 100 lbs. of milk in summer. A dairy cow produces other products of value to the farmer beside milk.

Credit for Calves and Manure

In winter the cows were given credit for 115 lbs. of manure and 0.017 of one calf for each 100 lbs. of milk. In summer the corresponding credits were 13 lbs. of manure and 0.009 of one calf. Yes, but what did it cost in dollars and cents to produce milk?

Average Cost and Bulk-Line Cost

The average cost of producing 100 lbs. of milk without charge for management, last winter (1919-1920), was $3.25. One dairyman produced milk for $2.50 a hundred pounds, while it cost another dairyman $4.61 to produce the same quantity. By eliminating the dairymen who had the highest cost it was found that the bulk of the milk, or 86 per cent, was produced at a cost of $3.83 or less per hundred. In the summer of 1919 the average cost of producing milk was $1.60 a hundred pounds, with a range in cost from $1.14 to $2.32 a hundred. During that summer 85.4 per cent of the milk produced by these dairymen cost $1.87 or less per 100 lbs. exclusive of management charges.

Western Washington, with her fine climate, her luxuriant pastures, her efficient dairymen, and her well bred cows is surely a cow country.

Have you talked with your neighbors about subscribing for Hoard's Dairyman? Why not do it now? Make up as large a club of subscribers as you can and send them in.

The Profitable Hog

Hampshires dress out a higher percentage of high priced meat with a less percentage of lard. Hampshires are the most economical pork producers—the most profitable for you.

Stuart—McIntyre—Hansen, Owners.

Address correspondence to Axel Hansen, formerly with John B. Irwin.

Lola Segis Pontiac Homestead

the highest record bull in southern Minnesota, heads our herd. His sire, Piebe Laura Ollie Homestead King, has more daughters that as 2-yr.-olds have produced 20,000 lbs. milk in a year than any other. His dam, a 34-lb. 4-year-old daughter of King Segis Pontiac Count, has 3 records averaging 33 lbs. and has made over 1,000 lbs. in 1 year. We have a few serviceable bulls and younger from A. R. O. dams for sale.

Clover Lea Farm, W. W. Walker, Owner. Austin, Minnesota

Sir Walker Segis Homestead

The best show bull and son of the great bull, PIEBE LAURA OLLIE HOMESTEAD, out of a "COUNT" daughter, BEAUTY BEETS WALKER SEGIS, world's greatest heifer, with two yearly records over 25,000 lbs. milk and 1,000 lbs. butter in heifer form, and a seven-day record of 35.03 lbs. butter from 730 lbs. milk.

We offer several choice bulls, one month to a year old, out of high yearly record and A. R. O. cows, at very reasonable present day prices. Pedigrees and photos will be sent.

A. J. LASHBROOK, - - Northfield, Minnesota

6 Good Cows For Sale

THE MINNESOTA KIND

They are all by a 36-lb. sire, are bred to a son of King Korndyke Colantha Ormsby, and are due to freshen this fall and winter. They are from 3 to 5 years old and absolutely straight and right. Lack of barn room forces us to sell.
Write or come and see them.

E. J. Brosious, - Stillwater, Minn.

Grandsons of Sir Pietertje Ormsby Mercedes

The sire is Sir Pietertje Ormsby Mercedes 22d a son of Minnesota's first 1000-lb. cow. These bulls are all nicely marked, straight top lines. Very good individuals from good A. R. O. dams.
For pedigrees and prices, write

Sire's dam, butter, 1 yr., 848 lbs.; her daughter, 1,055 lbs. Grandsire's dam, 987 lbs. at 11 yrs.; her full sister, 1,344 lbs.; another, same dam, 1,322 lbs. Dam, Miss Pietertje Alexina 3d, sister to Miss Pietertje Alexina 2d, 1,290.91 lbs. A dandy calf, priced right. Write quick to

McKAY BROS., - - CADDOA, COL.

THE MARK OF QUALITY

Success Insurance

"A Son of Count"

Suppose someone offered to insure your future success as a breeder and charge you only a small premium. Would you pass up such an opportunity? Not many of you would.

Oak Dale is offering some breeder the chance of a lifetime to buy herd insurance. The offer comes in the shape of a young Bull, a son of King Segis Pontiac Count, the greatest sire of all times.

"Count" has more daughters with over 700 lbs. milk than any other living sire. He is the only sire that ever lived with three daughters with over 700 lbs. milk under full age. He has more daughters with records above 1,000 lbs. butter than any other living sire. His daughters have won more first prizes in the past five years than the daughters of any other sire in a lifetime.

Buffalo Lois Beets, the dam, seven days 22 lbs. butter, is by a son of Paul Beets De Kol. One of this great bull's grandsons is the sire of the present world champion four-year-old. Buffalo Lois Beets bears the same relation to Paul Beets De Kol as does the sire of this world champion 46-lb. four-year-old.

This young bull traces twice to Pontiac Korndyke, Hengerveld De Kol, King Segis and King of the Pontiacs; once to Paul Beets De Kol and Sarcastic Lad. Thus, in the first five generations he has represented six of the greatest bulls the breed has ever known.

Is this herd insurance or not? Figure it out for yourself. The price of this bull is so reasonable that anyone can afford to pay it.

Write for complete information or come and see him, if you can. The farm is on the Oak Dale Trail at Blooming Prairie, Minnesota.

Larro

The Ready Ration For Dairy Cows

What kind of a dairyman makes the most money?

Who makes more money—

The man who uses a low priced ration—saving *one, two,* or *three cents* daily on a cow's feed?

Or the man who feeds Larro (under our absolute Money Back guarantee)—and *gets one, two, or three more quarts of milk* every day.

Who has the biggest bank balance at the end of the year?

There is one big reason why so many thousand successful dairymen use Larro—the simple fact that it makes more money for them—that it is the *cheapest* feed they can buy.

Write for literature.

"You Get More Milk Or Your Money Back" (11)

KIL-ZEM

Don't Be Pestered with Flies!

KIL-ZEM acts instantly. When applied with a fine fog sprayer it positively kills flies, fleas, lice, ticks, mosquitoes, bed bugs, cock roaches, and many other insect pests.

Kil-Zem protects all stock in barn or field from flies and other insect pests. It is non-inflammable: will not stain, mat the hair nor blister. Pleasant odor—will not taint milk. Prevents development of larvae when sprayed about farm buildings and stagnant water.

Kil-Zem has been proven superior to any other fly spray by many of the largest dairy farmers in Wisconsin and Minnesota. Approved by hundreds of herdsmen, and by Dairy Departments of State Experiment Stations.

Cows protected by Kil-Zem give more milk—young stock fattens more rapidly. Horses work better. Ask your neighbor—perhaps he uses it.

Sold direct to dairymen and other users in the following wholesale quantities, at prices named, f. o. b. Saint Paul:

In Barrels, (50 gallon steel drum included)	$1.30 per gal.
In Half Barrels, (30 gallon steel drum included)	1.35 per gal.
In Quarter Barrels, (15 gallon steel drum included)	1.40 per gal.
Special—2 gallon can, (sample order)	1.50 per gal.

SEND NO MONEY—All shipments C. O. D.

Our Kil-Zem booklet tells how to keep flies off your stock. Write for it—it's FREE.

Guaranteed to Do All We Claim for It

FREE!

To induce prompt ordering we will give absolutely FREE a heavy one-gallon galvanized air pressure sprayer with your first order for 15 gallons or more. Order today and get the benefit of this FREE offer.

After using one-fourth of the contents of any container in accordance with directions, any purchaser of Kil-Zem who does not find it superior to any fly spray he has ever used, as a fly killer and repellent, is authorized to return the balance to us for refund of total purchase price of the full container. That's fair—isn't it?

WESTERN CANADA

Land of Prosperity

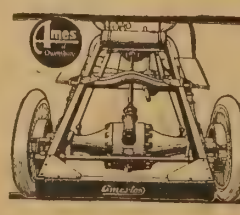
offers to home seekers opportunities that cannot be secured elsewhere. The thousands of farmers from the United States who have accepted Canada's generous offer to settle on FREE homesteads or buy farm land in her provinces have been well repaid by bountiful crops. There is still available **on easy terms**

Fertile Land at $15 to $30 an Acre

—land similar to that which through many years **has yielded from 20 to 45 bushels of wheat to the acre**—oats, barley and flax also in great abundance, while **raising horses, cattle, sheep and hogs** is equally profitable. Hundreds of farmers in western Canada have raised crops in a single season worth more than the whole cost of their land. With such success comes prosperity, independence, good homes and all the comforts and conveniences which make life worth living.

Farm Gardens, Poultry, Dairying

are sources of income second only to grain growing and stock raising. Attractive climate, good neighbors, churches, schools, good markets, railroad facitities, rural telephone, etc.



For illustrated literature, maps, description of farm opportunities in Manitoba, Saskatchewan, Alberta and British Columbia, reduced railway rates, etc., write

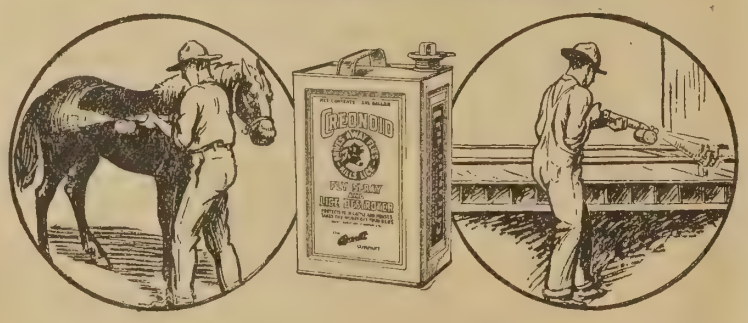
HOARD'S DAIRYMAN

A WEEKLY JOURNAL DEVOTED TO DAIRY FARMING

Contented Cows

Creonoid keeps cows contented. Spraying your cattle drives away the insect pests that hold down farm profits. Creonoid is safe, lasting, and does not gum the hair.



Increase Your Milk Profits

"I SAVE from $30 to $50 per month by the use of Creonoid," writes a farmer from Alta Loma, Texas. "By its use night and morning, my cows have practically 24 hours of peace and comfort . . . I have used Creonoid for more than a year in my dairy, and I find it so superior to all other 'fly dope' that there is no comparison."

That is but one instance among thousands, where Creonoid has increased the milk yield. Experts say that cows give 25% more milk, when freed from the fly nuisance. The lactation period is also materially increased.

CREONOID

FLY SPRAY AND LICE DESTROYER

CREONOID is a very inexpensive and wonderfully effective fly-spray for horses and all live stock. It is easy to apply. After its use cows will stand still at milking time, and should show an increase in weight and milk yield.

Creonoid will pay for itself many times over through increased farm profits. You will find what thousands of other farmers already know—that Creonoid means more milk per cow, more eggs per hen, more pounds per hog.

Creonoid comes in 1 gal. and 5 gal. cans, and in 50 gal. barrels. If your dealer doesn't carry Creonoid, write to us and we will see that you are supplied.

Illustrated booklet, describing uses and methods of application, sent to any address upon request.

Dairy Cattle on Farms

FOR the first time the federal census makes a distinction between real dairy cattle and beef cattle; that is, heretofore, dairy cattle have been carried under the general heading of milch cows which included also beef animals producing milk and all heifers 15½ months old or over. According to the census of 1920, there was a total of 31,386,378 dairy cattle on farms in the United States, 1,220,564 in villages and cities. Of dairy cattle on farms, nearly 7 million were calves under one year of age, 4 million heifers one year old and under two, 19½ million cows over 2 years old, and 750,000 bulls one year old and over. The states having one million dairy cows or over are Wisconsin, New York, and Minnesota. Because of changes in classification a comparison with the previous census is not practical, but it is believed there has been a substantial though not large increase.

Special figures for the states are as follows:

States	Cows and heifers two years old and over	Heifers one year old and under two years	Calves under one year of age	Bulls one year old and over	Total
Alabama	394,112	97,051	214,219	16,192	721,574

A County Fights T. B.

HOARD'S DAIRYMAN:—On May 1, 1921, the Allegany County Farm Bureau, New York, started a fight to the finish on tuberculosis. This was a result of a meeting of the executive committee only twelve days before, at which it was voted to adopt a five-year bovine tuberculosis eradication project. A county veterinarian is on the job, hired by the farm bureau, working under the federal department.

This project is not a half baked one. There was a real need for such a plan. Ever since federal accredited herd work started in the county two years ago, the demand for testing has grown by leaps and bounds, and the state was not able to do all the testing. Hence, the arrangement with the federal department. The plan is in writing and both parties have signed it.

The farm bureau is in active charge of this work. The veterinarian is not to work outside of his county. The farm bureau office is county headquarters. The county agent is "go between" for the farm bureau and farmers. The goal is, to test every cow in the county.

Salary and expenses of the veterinarian must come from the work he does, and therefore a charge of $1 each for cows tested, up to ten cows, and 50 cents for each animal above ten is made. These charges cover a second test, six months after the first, if reactors are found. If any animals look suspicious, a third test is made within the year. The intradermal test will be used. The subcutaneous test will be used if owners of animals want it, at a slight increase in charge.

The state continues to pay the cost of appraising and post mortem, and allows not more than $67.50 for grade cows, and not more than $112.50 for registered stock. If a cow is killed and no lesions are found, the state allows $75 for grades and $125 for registered animals. The Federal Department pays not more than $25 for grades and $50 for registered stock. Besides, reactors are property of the owner. The state appraiser and owner will set the value of reactors, and they must be killed and sold within the state.

Words will not tell what this five-year plan means to Allegany County. It can be told only in figures with a dollar sign in front of them. The loss from tuberculosis is enormous each year, and the only way to check the loss is to fight the disease to a finish. That is, to test every cow.

Pennsylvania. E. A. KIRKPATRICK.

A PRODUCT OF COW TESTING

FRANK M. CHASE, KANSAS

VIDENCE of the good work of cow testing associations is not lacking. It is written in many es in improved herds and better y practices. Perhaps the highest ice that one of these organiza- s can render, however, is to give a the interest and impetus where- e lifts himself from the obscurity he keeper of scrubs to the plane of successful breeder of registered le.

his is what a cow testing associa- did for A. B. Wilcox, one of the y good dairymen of Kansas. To a e extent his success has been a duct of cow testing; and in his ex- ience, methods, and ideas lies much hope and encouragement for the rage dairyman, to whom the same ans of progress are available.

Vilcox began to follow the dairy provement trail in earnest about years ago. At that time he was ming in Dickinson County, Kansas, milking grade Shorthorn cows, he had done previously in Western braska, dairying having been his occupation. In 1911, accompanied O. E. Reed, then of the Kansas ate Agricultural Col- e, he spent a day or in driving among neighbors and iends in Dickinson unty, the object being arouse interest in a testing association. a result 26 farmers eed to enter the pro- ed organization which ame the first cow ting association in state.

t is doubtful whether of the members ob- ned more benefit from association than Wil- , who held the posi- n of secretary for sev- l years after its for- tion. He began to put tester's suggestions to rations and man- ement into effect at e, and it was not long before he akened to the fact that his red s were not well adapted for milk duction.

He decided to raise Holsteins, and establish an all pure-bred herd of m as soon as possible. This he ld not do as quickly as he wished, pure-bred dairy cattle were very ch scarcer in Kansas ten years ago n now. In the entire Dickinson unty Cow Testing Association re was not one herd whose animals re all registered, while only a few the members had even a few head pure-breds. Wilcox wanted good mals to start with, so he made his rchases slowly and as he could find irable foundation stock, taking out three years to bring together a re-bred milking herd of about six- n animals.

The care with which he chose the cleus of his herd, as well as the importance of careful selection in herd building, is illustrated strikingly by his very first pure-bred purchase. This was a heifer which he bought as a calf in 1912. She was well bred, and he paid $90 for her when only a few days old. Before this calf had passed her fourth year, she brought to the Wilcox farm three more heifers, one of these meanwhile giving birth to another female. All four were sold, to the enrichment of Mr. Wilcox's bank account by $850. This amount can be fairly considered profit, for a careful computation of the original cow's milk production during this period revealed that her product paid all the expenses of her own keep, of the rearing of her daughters and the one granddaughter, and $147 besides. Thus, lacking $3, from an investment of $90 and within four years, this cow profited her owner $1,000. Nor was that all. Shortly after moving to Shawnee County, Kansas, early in 1918, Mr. Wilcox sold this cow at auction, as a six-year-old, for about $400. During his ownership of the cow eleven of her offspring joined the Wilcox herd. Ten of these were females, and one of the old cow's daughters still remains in it.

Among the herds of the Dickinson County Cow Testing Association, the Wilcox cattle led in production several years. For three years his herd of sixteen cows made an average net profit of $100 apiece yearly. One of his cows, Sunny Pauline, also held the state record for two-year-olds during two years, with a seven-day butter record of nearly 25 pounds.

In order to get onto a farm better adapted to his requirements, Mr. Wilcox moved to Shawnee County three years ago, where the dairy operations are now conducted on a 280-acre tract which includes a good deal of pasture land. Shortly after this change in location a son, Guy E. Wilcox, assumed the active management of the farm, though the hours that he puts in with the Holsteins do not greatly exceed those of his father. As before, the herd is in good hands, for in addition to developing a good herd of cattle and improving his methods in various ways, A. B. Wilcox reared a son in the ways of good dairy husbandry. Guy, naturally a lover of cows, equipped himself with special dairy training at the University of Nebraska, having graduated from this institution in 1915, so is admirably fitted to go on with his father's work.

A recent indication that the business is getting along well with the son at the steering wheel is found in the average production of 1,300 pounds of milk for the nine cows that milked during December. Also, as the senior Wilcox and I talked, he showed me the bank receipt for the milk of the nine cows for the last week of January, which was for $72.77, or considerably better than a dollar a day for each cow. For cows well advanced in their lactation periods and without effort being made to force them for a record, this is a very satisfactory showing.

Owing much of his success to the cow testing association, Mr. Wilcox still maintains his appreciation of this institution. In Shawnee County, as in Dickinson County, he was instrumental in the formation of a cow testing association, and by this means the entire milking herd is regularly tested. Here, too, the Wilcox herd frequently leads the association in the average monthly production per cow.

For several years the Wilcoxes have relied on a dairy ration which has been recommended widely by the Kansas State Agricultural College. This ration is made up of 1 part oil meal, 2 parts bran, and 4 parts corn chop, the cows being allowed in addition about all the alfalfa hay and silage that they will clean up. While the college has recommended that, as a rule, one pound of such a grain ration be fed for every four pounds of milk produced, these dairymen usually have not fed quite so heavily. They have made a special point of reserving for the cows the very best of the alfalfa hay produced on their farm, and of trying to have this of the highest quality. By having this roughage of the best they believe that they are able to save considerable in the amount of grain required. The logic of this is simple, as up to the capacity of the cow to handle this roughage, protein may be obtained much more cheaply in alfalfa than in grain feeds.

Regularity, kindness, and an abundance of outdoor exercise figure largely in the Wilcox methods of dairy management. "Treat a cow roughly and she will treat you the same way," is A. B. Wilcox's pithy summary of the need for careful and sympathetic handling of dairy animals. He also stresses the need for treating cows as individuals, especially as regards feed requirements. During all the mild weather of last winter the milking herd has remained in the barn lot the greater part of each day, being stabled at night. The lot is provided with feeding racks, and good protection against the wind and storms. The young stock, except the small calves, has remained outdoors all winter, being sheltered at night by the covered sheds.

AN ALFALFA FIELD IN DESCHUTES COUNTY, OREGON

Together the Wilcoxes now possess a herd of 27 head, 25 of which are females. Of the 19 females owned by Guy, 12 are two-year-olds by one sire. Both bulls trace to Pontiac Korndyke. Mr. Wilcox has specialized in this line of breeding since his start in pure-breds, some of his first registered animals carrying the blood of this noted sire.

For dairying, even in the midst of the present period of distress for nearly every line of farming, Mr. Wilcox sees a bright outlook. This applies to the production of both milk and dairy breeding stock, though he naturally sees the greatest opportunities for the breeder. In his view, the war period taught dairymen a lesson in regard to the scrub cow that they will not soon forget. "Under the stress of war the poor cow was found to be a very inefficient and wasteful machine," he says. "Because of this many farmers were forced to get better cows or quit dairying. During the next few years scrub dairy cows are going to be replaced by large numbers of well bred dairy animals, with good profits resulting to both the men who buy them and the men who sell them. It is a good time to raise good pure-breds."

A Low Hung Hay Wagon

H. E. WILKINSON, IOWA

A HAY wagon that will haul up to two tons of hay to the load and yet cannot be upset, and a power hoist that replaces a team in the haying rush, are two important parts of the machinery used at that season of the year on the J. S. Harrington Farm in Clinton County, Iowa. Hay has always been a major crop on the land under the Harrington management. Hence, the necessity for efficient and rapid handling of it.

The accompanying picture shows one of the two hay wagons now in use on the farm. It would be impossible to buy one like it anywhere. It was made seventeen years ago by Mr. Harrington. He saw the need of a hay wagon that would stand up under heavy and long continued use. And these wagons are in excellent condition today. As a young man, Mr. Harrington, by diligent practice and experimenting, in his little shop on the farm, became skilled in the use of blacksmithing and wagon-making tools. When he had designed these wagons and was ready to build them he bought the skeins, wheelstock, the necessary lumber and iron stock, and went to work.

Two two by eight fir bed-pieces, fifteen and one-half feet long, support the rack itself. These are hung with U-bolts beneath the rear axle, which is ten feet long and come together just behind the front axle, which is five feet and ten inches long, allowing for short turning. This makes room for a rack fourteen feet long by seven and one-half feet wide and only twenty-six inches from the ground. Ordinarily, three horses are required to pull the outfit when using a hay loader, although a tractor is sometimes used. For threshing, these wagons are very handy, since their low-hung body make high pitching unnecessary.

Six years ago Mr. Harrington built the power hoist shown here. The gearing was originally designed for a sawmill but works here very nicely. The drum is an old belt tightener pulley with wooden ends added. The control is simple. One lever works the clutch. The other brakes the dr as the rope is pulled back by the m operating the hay fork. Last year twelve-year-old boy handled the ho easily. Power is furnished by 3 H. P. gas engine. The outfit mounted on skids to permit quick a easy moving.

The small box to the right of t engine contains dry cells and an el tric bell, which is wired to a switc box on one of the stacker poles at t opposite end of the stack. The m who sticks the fork pulls a rope a tached to the switch when the fork loaded and the man at the hoist ge the signal above the noise of the e gine.

This field outfit will build a sta sixty feet long by eighteen feet wid holding from twenty-five to thir tons, depending on the kind and co dition of the hay.

A HAY HOISTING DEVICE

A LOW HUNG HAY WAGON

OREGON DAIRY NOTES

E. L. BALLARD, OREGON

DAIRYMEN in Oregon are attempting to legislate the scrub sire out of existence. They secured passage by the legislature of a law requiring any dairy bull offered for sale in the state to be licensed by the State Dairy Bull Registration Board, which is set in the law as the Dairy Husbandry Department of the Oregon Agricultural College ex-officio. In order to secure a license the owner of the bull must make application to the Board showing, with the application, certificate of registration. The Board is authorized to refuse a licensed certificate to any bull known to be infected with a dangerous disease or that is known to transmit inferior qualities to his offspring. In case the supply of suitable dairy bulls shall at any time fail to meet the demand, the Registration Board has authority to waive the requirements of the law for a stated period of time. The new Board was also authorized to gather dairy statistics through county assessors, county agricultural agents and others. Protests against decisions of the board may be made, following which direct examination of the bull in question shall be made by three qualified men, one appointed by the registration board, one by the owner, and the third by these two in conference. There is much interest in the bill and its effect upon the dairy industry.

The Oregon Farm Bureau Federation has established offices in Portland with the Oregon Dairy Council. The federation affairs are in charge of State Secretary P. O. Powell of Monmouth, a substantial Willamette Valley farmer and a member of the last legislature. The organization work has been temporarily suspended during the busy spring months and attention is being directed to getting results on some of the projects which have been adopted. No project has yet been developed directly along dairy lines, but the federation has gone on record in favor of commodity co-operative associations and is rendering support to the Oregon Dairymen's Co-operative League.

The farm bureau project attracting most attention at the present time is the organization of the Oregon Wool and Mohair Co-operative Association which will assume legal status as soon as owners of fifty per cent of the sheep and goats of Western Oregon have signed the five-year contract. R. A. Ward, former vice-president of the First National Bank of Bend, Oregon, who developed an agricultural program for the bank which attracted national attention, is acting as organization manager of the association. The State Farm Bureau was also active in organizing the Oregon Wheat Growers' Co-operative Association which is signing up a large percentage of the wheat in many counties, a total of three million bushels having been signed already in the campaign.

Governor Hart of Washington vetoed the bill passed by the Washington legislature appropriating $20,000 to the Western Royal Live Stock Show at Spokane and $10,000 to the Pacific International Live Stock Exhibition at Portland. The Idaho Legislature was a little conservative and killed the bill appropriating $20,000 to the Northwest Live Stock Show at Lewiston before it got to the governor. The various managements are going ahead, however, and making an effort to continue the excellent standard of the Northwest show circuit.

There are now fourteen gold medal Jersey bulls, according to records of the American Jersey Cattle Club. Of these, seven are Oregon bulls and the eighth is owned in the state of Washington, which gives the Northwest a distinct lead over any other section of the country. Oregon feels pretty proud of her excellent Jerseys. A recent checking of the records showed that Oregon Jerseys were either first or second in seven of the eight classes in the Registry of Merit.

One of the most successful co-operative marketing associations in the Northwest is the Pacific Co-operative Poultry Producers' Association, which has a membership of nearly 400 poultrymen owning 210,000 hens in Western Oregon and Southwestern Washington. The headquarters of the association are in Portland. Last year the organization handled 782,000 dozen eggs valued at $432,000. Carload shipments were made to New York and other eastern cities. Prices returned to the producers were far above Northwest quotations.

The association's plant has been enlarged for this year's business which will be more than twice that of last year. Cold storage facilities have been secured and the spring surplus production is being held. Eggs are graded and during the spring months producers have received at all times at least eight cents above the general market for the better grades.

The ladies of Grants Pass, Oregon, have established milk stations in pub lic schools, working in co-operatic with the home demonstration agen At the start milk was supplied eight six children in three school rooms. C this number forty-seven were at lea seven per cent under weight. After trial of three weeks, it was decide that the results justified the time an money necessary to make milk availa ble to all the school children.

The number of silos in Lincol County doubled last year. Lincol County is one of the Pacific Coas counties lying between Coos and Till amook Counties. Because of its rough er topography it has not developed a rapidly as the neighboring counties but has many of the same advantages as a dairy district. Sunflowers, corn oats, and some native grasses hav been found excellent silage crops. Al though producing a large yield, sun flowers do not prove so satisfactory an ensilage crop in the coast counties as in other sections of the state. Just why this is so is a matter for future determination.

The Clatsop County Cow Testing Association has recently organized for its second year and 650 cows have already been signed up. Still more dairymen are anxious to join the association and it is thought possible that a second tester must be employed.

The people in Walla Walla Valley in Washington believe they have the largest boys' and girls' dairy calf club in the West, having organized recently a Holstein club with twenty-five members. One hundred and seventy-eight Holstein heifers have already been secured for the boys. They were purchased in Yakima Valley.

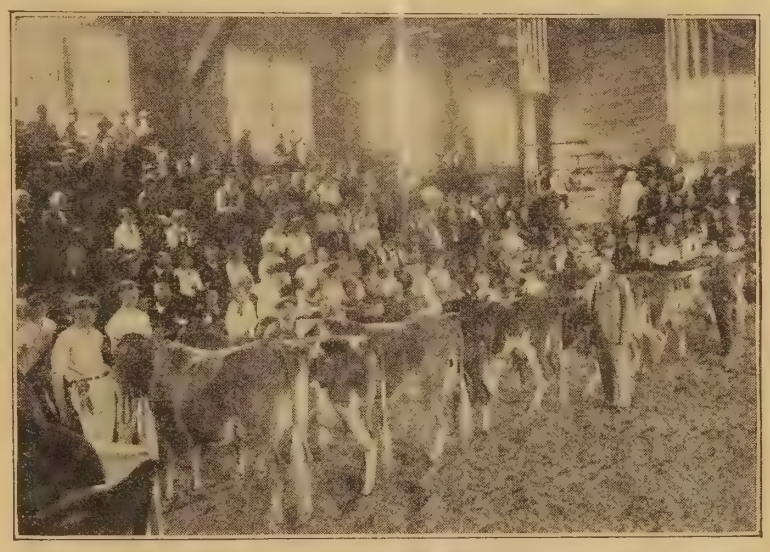
THE THIRD ANNIVERSARY OF AN IDEA

C. R. GEORGE, INDIANA

WHEN the Guernsey breeders and enthusiasts of Indiana gathered at Lebanon on June 4th for the third annual show of the Boone County Calf Club they had a dual purpose in view. One was to measure and observe the progress of the calf club work. The other was to celebrate the third anniversary of an idea. The idea in question was the father of the modern dairy calf club project which is organized on a three-year plan and the Boone County Guernsey Calf Club was the first-born of this most prolific sire. The plan of organizing the clubs on this long time basis was worked out at Purdue University in 1918 and put into operation on July 5th of that year when the Boone County Club was organized. Previous to that time many junior calf clubs had been started but they were formed on a short time basis and most of them had sales at the close of the project. It was felt that this would tend to develop dealers instead of breeders, and to overcome this tendency the long time project that encourages permanent ownership of the animals was developed.

The show held at Lebanon to complete the work of this first club was a fitting answer to the desirability of the plan. When the bugle blew as a signal for the calf club parade to move, 67 head of pure-bred Guernseys with their young owners at the halter swung in behind the brass band and the four cars carrying the officials of the city of Lebanon, the American Guernsey Cattle Club, and the Indiana Guernsey Breeders' Association. They in turn were followed by delegations of visiting calf club members from other clubs over the state who came to see the show and to help with the celebration. The Hendricks County Club, the Carroll County Club, the Sheridan Club, the Argos Club, and the Marshall County Club were all well represented and the enthusiasm of these junior breeders added zest to the occasion.

One might wonder how 25 calves distributed in 1918 might increase to 67 head in three years. This was done through the organization of a second division of the club with 14 members the following year and a third division with 12 members in 1920. Forty-two of the original club animals are still owned by the members and 37 of them were shown. Thirty additional calves and yearlings were shown in the classes for offspring. These were from the two crops of calves from the heifers in Club No. 1 and the first calves from the heifers in Club No. 2.



A unique feature of this show was the fact that all three stages of a calf club project were represented. Club No. 3 held its first show, Club No. 2 its second show, and Club No. 1 its third and final show. This made the show especially valuable.

A survey made at the close of the project for Club No. 1 shows that the 25 calves distributed July 5, 1918, went to 19 different homes. Of this number 15 members completed the project although five of these did not keep production records and 7 did not keep feed records of their cows during the third year. These 15 members represented 11 homes. Four other members representing 4 homes still have their cows but did not exhibit them in the final show. This makes a total of 19 members from 15 homes still owning their club animals at the end of three years.

Records of Production

Ten members kept complete records of production during the first lactation period and the showing which they made speaks well for the quality of the cows and the care given them by the members. These first calf records varied from 400 lbs. of butterfat made by Imp. Boone's Topsy, owned by Eugene Buchanan, to 244 lbs. of butterfat. Seven of them made over 300 lbs. of fat and the average for the ten head was 6,638 lbs. of milk and 323.1 lbs. of fat.

The club work has been a financial success even during this period of development which included only one year of production, for the records show an average net profit or labor income per member for the three years amounting to $554.63. It is interesting to compare the feed cost for the third year which averaged $107.94 with the value of the product for the same year which averages $231.41. This leaves a net return per cow from milk alone, after the feed was paid for, amounting to $123.47.

BOONE COUNTY GUERNSEY SHOW

Scoville, Mills, and McNagny placing the ribbons in Club No. 1. The show was held in the high school gymnasium, the floor of which had been covered with heavy paper and sawdust.

The Club Show

The club show was held in the large new high school gymnasium where the 500 to 600 people who came to hear the talks and see the judging could be seated in a comfortable way. The meeting which followed the parade was opened by P. H. Crane, president of the Indiana Guernsey Breeders' Association. Mayor Tower of the city of Lebanon was introduced for a few words of welcome and a response on behalf of the Guernsey interests was given by W. O. Mills of Mooresville. President Robert Scoville of the American Guernsey Cattle Club gave a most interesting talk directed primarily to the calf club members in which he complimented them on the fine work that they had done and encouraged them to go ahead with the breeding of Guernsey cattle after their club work was completed. E. J. Barker of the State Board of Agriculture told in a brief way of the Dairy Cattle Show at the state fair and asked for a good showing of Boone County Guernseys. President Scoville assisted by W. O. Mills of Mooresville and Rob R. McNagny of Columbia City judged the seven different classes in the show.

Awards for Club No. 1

In making the awards for the club contest the animals are first placed on individuality and then this placing together with such factors as the methods of feeding, production of milk and butterfat, quality of bull to which animals were bred and a story of the work are all considered in placing the final awards. In the third year's work the individuality counts 20 points, the feeding 20 points, production 40 points, quality of the service bull 10 points, and story of the work 10 points.

In the awards on individuality for Club No. 1 were: 1st, Morris Crain on Imp. Boone's Fanny; 2nd, Robert and Carl Nelson on Imp. Boone's Daisy; and 3rd, Noble Crain on Imp. Boone's Carrel's Princess.

The final awards for the third year contest in Club No. 1 were: 1st, Chester A. Jones with 96.3 per cent; 2nd, Arthur Van Huss with 93.4 per cent; 3rd, Robert and Carl Nelson with 93.1 per cent.

IMP. BOONE'S VALENTINE

First prize heifer, Club No. 2, and champion club female, shown by Chas. Nelson, Indiana. Charles with his heifer won first place in final awards for Club No. 2 with a score of 98 out of a possible 100.

Awards for Club No. 2

Club No. 2 completed the second year of the club project which should end at the time when the heifers freshen. Five of the ten animals shown were in milk having freshened recently while the remainder were mostly heavy in calf.

The awards for this year were based on 40 points for individuality, 20 points for feeding, 20 points for service bull, and 20 points for story.

The final awards for the second year contest in Club. No. 2 were as follows: 1st, Charles Nelson with 98 per cent; 2nd, Katherine Jones with 96 per cent; 3rd, Ralph Howard with 94 per cent.

Awards for Club No. 3

The calves in Club No. 3 were shown in the first year contest which gives 40 points to individuality, 30 points to feeding, and 30 points to story. The awards on individuality were placed as follows:

1st, Coza Chambers on Imp. Boone's Neta; 2nd, Bernice Adair on Imp. Boone's May; 3rd, Helen Adair on Imp. Boone's Tiney.

The final awards for the first year's contest in Club No. 3 were:

1st, Coza Chambers with 97 per cent; 2nd, Helen Adair with 96 per cent; 3rd, Bernice Adair with 93.8 per cent.

Awards to Offspring

The showing of the 30 head of calves and heifers in four different classes for offspring was a most interesting feature of the program. These were the "fruits of the vine" and offered a good indication of what these calf club members would do as breeders in the future. The very high quality of the entries was a surprise to all.

On female offspring over one year old Robert and Carl Nelson took first prize on Boone's Pansy, as also champion female, Lowell Denny taking first on heifer calves under one year. For male offspring over one year old, Areva Van Huss took first place on Dividend's Kitchener, as also champion bull, with Robert and Carl Nelson taking first on bull calves under one year.

It is encouraging to know that as this club work develops the interest in the project and in the breeding of Guernsey cattle is spreading very rapidly in the community which covers the larger part of Boone County. One feature of the organization which has been quite largely responsible for this interest has been the work of the advisory committee of farmers and breeders who have been given a definite responsibility in looking after the club members and checking up on the work, and this responsibility has resulted in an unusual interest on the part of these men.

Washington, D. C., Weekly News

[SPECIAL TO HOARD'S DAIRYMAN]

WASHINGTON, JUNE 21—The passage by the Senate of the Packer Control bill on Friday afternoon clears the atmosphere and indicates clearly the congressional line-up on this matter which has been pending as a source of contest in Congress for at least a dozen years. The bill is not finally passed as this is written, but the House has voted by a very large majority to pass the Haugen bill, and the Senate, after adding several amendments making this bill more drastic, scoring a close vote on each amendment, finally passed the amended bill by a vote of 45 to 21. So the chances are that should the House fail to accept the whole of the Senate amendments a compromise will be reached in conference somewhere between the two measures.

A strong fight has been waged against this legislation on the ground that it was putting the government into the control of business in violation of the pledge of the President that there should be "less government in business". That two-thirds of the members of the House and 45 to 21 of the members of the Senate—the rest being paired—voted for the measure, indicates that the sentiment is overwhelming in favor of control.

Banking control has been a matter of course for many years and railroad control for two generations. Looming right up ahead is coal control. To quiet apprehension, however, that the government is embarked on a wild career of control over everything and everybody, it ought to be pointed out that it has taken twelve years to convince Congress that the packer business was of such public importance that control was necessary. It will take some years before coal control is effected.

⚜

Final amendments to the Packer Control bill left the definition of the products which are to be followed through trade channels by the control officials, operating under the direction of the Secretary of Agriculture, so that only the products of the business of slaughtering live stock are included. This leaves the butter, egg, and cheese business and also the purely vegetable oleo business outside this authority. However, in another section of the bill as amended all the business of the "Packers" must be conducted on uniform accounting lines, under supervision, and this will of course include dairy and poultry products, oleo, and everything else.

⚜

Cold storage hearings before the House Agricultural Committee Tuesday, Wednesday, and Thursday, resulted in complications rather than clearness, and adjournment was taken Thursday, with an agreement between the Committee and the representatives of the Cold Storage Association that the cold storage people would get together among themselves and come back next week with a program on which they would agree. Features of the hearing were the protests of the apple shippers against time limitations and the necessity of marking every package, and the protests of large manufacturers of butter against the provisions of the bill making butter in storage over 30 days carry the "cold storage" mark. This, it was explained to the committee, would penalize all butter so marked as to price, whether it was good, bad, or otherwise. "All butter is cold storage butter," said J. A. Walker, while making a prepared statement. "We put butter into storage the moment it comes from the churn. I am in favor of going the whole course and marking it all storage, and teaching the public the facts, rather than having it arbitrarily marked and penalized at any point after that. We are suffering from public prejudice against storage butter and we want to correct that prejudice rather than strengthen it."

Professor George L. McKay told the committee of experiments in the keeping quality of butter in storage, showing that some butter was better when it came out of storage than other butter when it went in. The gist of Dr. McKay's testimony was to the effect that the time which the butter was kept in storage was not the essential factor and that since the labeling provided for in the proposed law covered only time, it was not the big question in so far as the measure related to public health and commercial honesty.

It is interesting to note in this connection that the Dairy Division has recently taken samples of butter out of storage in San Francisco, which have been sent here and tested, which were made during the earlier period of the war, and put into storage in 1917. More than three years in storage was the record of this butter but it showed up here after being shipped from the Pacific coast not in cold storage, and was tested here and found to be in fine condition. Some of it tested by New York experts was scored at 92. That is, this butter came out of three years storage as good as most butter when it enters storage.

⚜

The Federal Trade Commission has made public its report of an investigation of the milk and milk products trade during the period of 1914 to 1918. This investigation was authorized by a resolution adopted in the 66th Congress by the U. S. Senate. The report includes statements of the business, the prices, and the profits in the milk products industries including canned milk, butter, and market milk industries, and is detailed and interesting. A single paragraph from the report on "profits in the butter industry" may be worth quoting here. "Butter prices of jobbers increased in the five-year period 72 per cent; those of retailers 59 per cent. Prices of centralizers, who reported to the Commission both prices and costs, advanced 74 per cent, while costs advanced 79 per cent. Profits per pound declined 25 per cent, and percentage of profit on sales of current production (disregarding inventories) declined from about five per cent to about 2 per cent."

This is about as clean a bill of health and answer to the cry of "profiteering" as any industry has been able to show.

The paragraph of the report on "unfair practices" is surprisingly short and includes "false testing of cream", "employing agents of common carriers", "false advertising", "price discriminations", and "furnishing of cans without charge to producers" among a number of others. An interesting paragraph deals with profits of market milk distributors quoting one firm in Minnesota which made less than one per cent, and one firm in New York that made 52.4 per cent.

The First Pool Check in New York

H. H. LYON, NEW YORK

I SAW pool check number one of the Dairymen's League Co-operative Association, Inc., today. This check is written for $246.91 and it goes to A. R. Case. I saw other checks being written on special machines made for that purpose. In the League office there are thirty-two of these machines, but only a few of them are in use today. The clerks are just practicing up a little getting ready for the race. None of the young ladies who are to operate the machines have yet gotten up speed. I timed a few and I think there will be little difficulty in getting them out at the rate of one a minute. It does not follow, however, that such a speed can be kept up all day for the entire eight hours. It may be a larger average than that, but I would think that it might average very much lower. They may be able to get out 15,000 a day but if they get out 10,000 I shall say they are doing well.

Time and again have I heard that no accounting is to be made concerning the funds of the pool. Well, on this first check and on every subsequent one there is a good deal of information. Rather this is on a narrow strip attached to the check. This strip extends the whole length of the check proper. It gives the number of pounds of milk delivered by the patron, its fat test, the pool price, which means the price paid into the pool by the dealer, and the amount, also deductions and the amount of the check to the farmer.

The information entries on this check are as follows: Pounds milk, 15,337; test, 3.6%; pool price, $1.74; amount, $266.86; League deductions: advertisting, $.77; certificates of indebtedness, $15.34; pool expenses, $3.53; organization, $.31; check, $246.91.

These League deductions are figured as follows for 100 lbs. of milk: Certificates of indebtedness, ten cents, advertising one-half cent, to turn back to the local leagues to carry their organization two-tenths of one cent, and for operating expenses of the pool, 2.3 cents. This amounts for the month of May to thirteen cents a hundred pounds of milk, and ten cents of this is to be returned on January first in the form of an interest bearing certificate payable in five yearly installments. One thing does not appear on this slip and that is the fact that considerable quantities of products are in storage to be disposed of according to market conditions. This has been inventoried and a tentative valuation of 15.5 cents a hundred pounds of milk is placed upon it. Then again the base pool price is not given, which is $1.58 a hundred for three per cent milk.

Lest some one like myself who likes to "fool" with figures should attempt to figure out the above memoranda, let me add a little explanation. I soon got stalled when I figured. Remember that the "pool price" includes the 15.5 cents deferred on storage goods, and really is $1.735.

Mr. Case is credited with $1.58 a hundred for his milk on a basis of three per cent test at 200-210 miles from New York. His test is 3.6 and he is far enough out so that his extra freight differential amounts to eight cents a hundred. His test adds 24 cents, his freight deducts 8 cents, his certificates 10 cents, and the three expenses charges 3 cents. The addition is 24 cents and the total deductions are 21 cents. This leaves him $1.61 for May. We should go a step further in explanation. His certificate of indebtedness of 10 cents a hundred is his to realize on later and there is in addition supposed to be 15.5 cents a hundred to come to him from goods now in storage. Should all this prove out as is now understood his price per hundred is $1.865, or a total addition of 25½ cents to the actual price he received in May.

Here, however, is a very important addition to make. Some one may glance over these figures and remember that a thirteenth payment is promised for the year to take up any proceeds made available by final sales. If 5, 10, or 15 cents should be formed each month for the year one may get the idea that he is likely to get a big check. Now, it is going to be a small one. As the goods in storage are sold the proceeds will go right into the pool. It would not be impossible for patrons to get that 15 cents in their June or July checks, although it is likely to be a month or two more before it will all come back. It is very probable that the most of these monthly deferred credits will be paid before the end of the year. Better look for that extra check to be a small one.

My understanding is that the League folks furnish 434,000,000 lbs. of milk for May, of which 261,000,000 is pooled. In addition the League plants handle 45,000,000 lbs. which after deducting expenses is also pooled. The certificate of indebtedness amounts for May to $261,000. The amount deferred on storage goods is $404,550, making a total withheld for the first month $665,550. I do not know precisely the sum to be checked out, but if in the freight differentials there is as much added as deducted and the average test is 3.5 per cent it figures over $4,300,000. The League and operating expenses are over $60,000, apparently. This is less than we had reason to expect, and it includes depreciation for the month on equipment.

Some one says these expenses and the certificate deductions will mount up as time goes on. I beg to differ. It will not take as many employees to do the same work when once the "ropes" have been learned. There may be more plants acquired, it is true, and that will add to the cost to be carried. On the other hand, thousands of our members are not in the pool for May because of various technical points. As these are added it will make a little more work but I look for acquired efficiency in the office force to take care of that without additional cost. The millions of pounds of milk to be added to the pool over which all deductions are to be spread will, I believe, take care of any additional costs, and probably more than that.

Granting that the above figures are substantially correct, and I have sought to be accurate, where are our pool fighters that are honest men? There were honest objectors to the pool, but it seems to me that they have no place to stand any longer. Those continuing to object are either stubborn, I fear, or worse. True there are questions of policy to be solved, but the working of the pool, as Mr. Weiant says, needs now only "oil on the bearings".

NEW WORLD RECORD FAT PRODUCER

F. E. ELLIS, CANADA

WHAT is perhaps the most coveted of all inter-breed championship honors, the record butterfat production of a year, has changed hands again after staying safely for six years with Duchess Skylark Ormsby, the Minnesota Holstein owned by J. B. Irwin. In 1915 this great cow completed what then seemed the unbreakable record of 1,205.08 lbs. of fat in the year. The new champion, who completed her record on June 18 last, is also a pure-bred Holstein, Bella Pontiac, with a production of 1,258.4 lbs. of fat from 27,017 lbs. of milk. She is owned by Mr. T. A. Barron of Ontario. Perhaps the most interesting feature of the new record is that it was made in an ordinary farm stable by a young farmer who was not overburdened with this world's goods and confesses that it is no cinch to milk a cow four times a day for a year while doing a lot of other chores and attending to his regular farm work. Perhaps Mr. Barron will not object if I tell a part of his story.

When Mr. Barron purchased a small farm a few years ago he was almost altogether without farm experience. His father was a miller, but the young man had always had a hankering for farming and the result of his inclinations was the purchase of "Vimy Ridge Farm", as he calls his place. It is just an ordinary farm of fair fertility with a small brick house and barns that most breeders would not consider modern or up-to-date. Certainly there is nothing about the Vimy Ridge buildings to attract the attention of the passerby. His lack of experience was a handicap that he overcame fairly quickly, but he soon found that the drag of a poor class of live stock made worth-while progress impossible.

It was his banker who finally headed Mr. Barron in the right direction. He called him into his office one day and addressed him somewhat as follows: "Look here, Barron, we are not getting anywhere with this proposition and neither are you. We have been lending you money but you are working with the wrong kind of tools to make proper use of it. Now, here is our proposition: You go out and buy some good pure-bred dairy cattle and we will back you up; or, if you want to go ahead with the kind you've got, you can do so on your own responsibility"

Mr. Barron decided to make the plunge. He had no choice in the matter. Otherwise he might not be the present possessor of Bella Pontiac. He purchased several animals at moderate prices and the uniform success that he has had with these animals would indicate that the young man has a special aptitude for handling high class live stock. At any rate he has made several fine records since then, the culmination of them all being the world's record for yearly butterfat production.

The purchase of Bella Pontiac was almost an accident. It was the first year of the "flu". Mr. Barron had been sick and on the day of a neighbor's sale he was not able to do much work, so jumped into his car and went over. He bought Bella Pontiac for $175. When she freshened at four years and three days old, he entered her in Record of Performance test and, although she was just on pasture, she did well and when she had been milking five months she was officially tested for one week, making 13.2 lbs. of fat in seven days. This is not a large 7-day record but she proved herself a consistent producer by finishing her year with 20,129 lbs. of milk and 814.4 lbs. of fat.

She was not long dry when she freshened again and was started on her big year's work. It has been the intention to give her an official test soon after freshening but several months went by before an official supervisor could be obtained. This time she made 26.4 lbs. of fat in seven days. It was about this time that Mr. Barron became aware that his cow was going at a world record clip. The Holstein Association became interested and for the final months of the test the Association kept two inspectors constantly at the farm, thus making this part of the record official and, of course, the entire record was under the supervision of the Record of Performance inspector. Her production from month to month was remarkably consistent as is illustrated by the following chart:

	Lbs. milk	Lbs. fat
June	626.75	26.95
July	2424.25	104.24
August	2438.75	104.85
September	2609.50	112.21
October	2488.00	122.11
November	2486.00	124.30
December	2484.00	115.44
January	2330.00	106.99
February	2062.75	107.26
March	2153.75	121.83
April	1973.75	84.38
May	1752.50	73.51
June (18 days)	1160.00	47.94
	27000.00	1252.01

It will be noticed that her fat production dropped off seriously in April and May. The drop indicates the time when the silo went empty and although the allowance of mangels was increased from 70 lbs. to 150 lbs. a day, this did not sustain her production of fat, although the milk kept up fairly near to the old mark. Had the supply of ensilage held out she would have had a greater record to her credit. As it is, she averaged just about 24 lbs. of fat a week for the entire year, and when we consider that many good breeders have never had a cow make 24 lbs. of fat in a week when at their best, this record seems all the more remarkable. Eleven months after calving on official test she produced 20.18 lbs. of fat in seven days and her production for the last 50 days of her test is a world's record for that period.

His work with Bella Pontiac does not represent all of Mr Barron's official testing. He had started a couple of cows on test—his first purchases—before he even purchased Bella, and, as he made some good records, followed by some good sales, the financial strain under which he had first labored has been largely removed. Dora Fayne Posch, for instance, made 13,281 lbs. of milk and 490 lbs. of fat as a two-year-old. She was dry 12 days and after freshening made 20.8 lbs. of fat in seven days and 41.2 lbs. in 14 days. That year she made 16,880 lbs. of milk and 690.4 lbs. of fat in Record of Performance. The following year, after being dry only 33 days, she made 28.8 lbs. of fat in a week and was sold at the National Sale in Toronto for $1,000. I might mention other records made by this breeder but that of Dora Fayne Posch demonstrates the fact that Mr. Barron had to put in two or three years gaining experience before he was able to feed a world's record cow.

The ultra-fashionable strains of today are notable by their absence from the pedigree of Bella Pontiac. She has, however, good honest producing ancestry back of her for several generations. She is a granddaughter of the splendid old transmitting sire, Brookbank Butter Baron, with 38 tested daughters, and her dam is a sister of the former Canadian champion, Queen Butter Baroness. Her sire, Pauline Pet's Pontiac, has four tested daughters and is a brother of Calamity Snow Pontiac who produced 992 lbs. of fat in one year from 28,443 lbs. of milk, and is the third highest cow of her breed in Canada. Bella Pontiac, therefore, is not a sport. She has honest breeding behind her and in previous lactation periods has proven herself a consistent producer.

Mr. Barron now owns Bella and two of her daughters. He has a big problem to decide. Will he sell Bella and her offspring for the big price that they will command or will he retain them as the foundation of a future herd? Mr. Barron does not know. He hasn't had time to think. He has a lot of visitors to entertain nowadays and he is still doing his farm work much as if he did not know that he had made his fortune in the performance of one cow. There is another story worth telling. Bella's first calf was a bull. When it became evident that she was going to make a great record, a neighbor, Mr. H. H. Bailey, started out to locate this animal. He found him in a grade herd and due to be sold to the butcher in a few weeks' time. He was then purchased for a merely nominal sum and now that he has gotten a few months of good feeding he has proven to be a first class individual. Fortunately, this bull is sired by a close relative of May Echo Sylvia.

As I write I learn that Bella closed her test, milking over 70 lbs. a day and will be continued in the hope of making 27,500 lbs. of milk and 1,280 lbs. fat, equivalent to 1,600 lbs. of 80 per cent butter.

BELLA PONTIAC, CHAMPION BUTTERFAT COW OF THE WORLD

F. Lothrop Ames

F. Lothrop Ames, foremost Guernsey breeder of America, died in a Boston hospital Sunday, June 19. Mr. Ames had been very ill for several weeks, his condition gravely concerning his fellow breeders as early as the date of the annual meeting of the American Guernsey Cattle Club, May 13. By the time of the Massachusetts Guernsey breeders' sale, June 9, the many friends of the famous breeder were encouraged by news of his improvement. Now comes the report of his death, carrying a sense of great loss throughout the entire dairy husbandry world.

Few men in the history of dairying have contributed so largely to the improvement of a breed as the owner of Langwater Farms. In his hands May Rose Guernseys were molded, seemingly at will, into a distinct type. So evident was the perfection reached that this family of Guernseys soon gained a popularity never equalled by another. Breeders from coast to coast, in their ardent seeking for that blood, have paid the highest tribute which may be given a breeder.

River Falls Show

The live stock show at River Falls, Wisconsin, June 16 and 17 was one of the largest and best ever held in that part of the state. This show is an annual affair, the first having been held eight years ago. At that time very few animals were shown and three-fourths of them were grades. This year 255 animals were led into the show ring, 60 exhibitors showing. There were 53 Guernseys, 39 Jerseys, 82 Holsteins, 76 Shorthorns, and 5 Angus.

Twenty-one farmers donated pure-bred bulls to be offered at auction, allowing the entire proceeds to go to defray the expenses of building new stock sheds. The bull sale was a decided success considering the times. Twenty-one animals brought a total of $1,370, or an average of $65.

Wisconsin. J. M. MAY.

League July Price

It is unofficially announced that the price of fluid milk in New York will be advanced from $1.95 to $2.20, and that this advance is to be absorbed by the dealers and not passed on to the consumer. Manufacturers' prices are to remain at $1.55 and $1.50, with fourth class to depend as formerly on the market price of butter and cheese.

The cultivated crops are good for your morale. The procrastinator seldom gets far with them.

EDITORIAL COMMENT

A cow owned by the Dairy Division produced in one year 470 lbs. fat and received nothing but roughage which consisted of alfalfa hay, corn silage, and pasture. The following year she received grain with the roughage and produced 820 lbs. of fat or 350 lbs. more fat. The extra 350 lbs. of fat may be credited to the grain fed; however, we should not neglect to consider that cows vary in production even under the same system of feeding. A cow that can produce 470 lbs. of fat on roughage alone and 820 lbs. when fed grain is an animal of large capacity. She is the kind that should be used as foundation stock.

It may be stated that the extra fat produced by feeding grain did not return a profit. This does not indicate that it is unprofitable to feed grain for in this particular instance attempt was made to determine the capacity of the cow and economical feeding of grain was not considered. It must be borne in mind there is a difference between feeding for profitable production and possible production. There is no question but that some grain could have been fed to this cow and she would have returned a profit for it. In most cases the feeding of grain pays, but the quantity fed must be determined by the capacity of the cow, the price of grain and of dairy products.

COLLECTIVE BARGAINING BILL

We have favored and urged that the farmers cooperate in the marketing of their products. If done in the right way it is a more economical and efficient way of marketing farm produce and therefore of benefit to both producer and consumer. In recent years milk producers have formed organizations and have elected representatives to sell their milk. This brought trouble to several milk producers' associations, for it was held by some governmental and city officials that to sell milk in this way was a violation of the Sherman Anti-trust law. Arrests were made and those elected to sell the farmers' milk collectively were arrested and cast in prison. They were acquitted in every case, for the courts did not find any law had been violated by them.

In order to put a stop to any danger of governmental and city officials interfering with representatives selling milk for farmers' associations, several states enacted laws legalizing collective bargaining, and a bill was introduced in Congress permitting all co-operative farm organizations to sell their products collectively. Certain restrictions were provided in the latter bill in order to prevent monopoly or a misuse of such power. This bill has had a troublesome time in Congress. It has been amended and revised several times. So far as we can determine it extends no rights for selling farm products collectively that the laws do not already provide. It does provide for supervision of co-operative farm organization in respect to selling their products.

We believe the present bill has been so amended as to make it of little value to co-operative societies and that a new bill should be drawn which would extend to every co-operative organization, farm or otherwise, the right to sell their products collectively. It should contain provision that will not permit the misuse of such rights or privilege. Co-operative associations can weary along under the present laws, but it is irritating and expensive to have their representatives hauled into court by some overzealous officials and be forced to prove they have violated no law. It would be well to have a national law which would preserve the right of selling products co-operatively and do away with arrests and court proceedings.

FILLED MILK LEGISLATION

A hearing on the Voigt bill, which proposes to so amend the national pure food and drugs act as to make the interstate shipment of filled milk a misdemeanor, was held before the Agricultural Committee of Congress on June 13th. The hearing was not completed, but the committee has planned to continue it after July 4th.

We have come to the conclusion that it would be a waste of time to continue the hearing on the Voigt bill. First, it is very doubtful if it would be constitutional to prevent the interstate shipment of filled milk; second, the secretary of agriculture is opposed to this bill, and this would make it difficult to enact into a law; third, some of the farm organizations are against it; fourth, if the bill were passed the manufacturers of filled milk could obtain an injunction restraining its enforcement and it would require several years to dissolve the injunction; and, fifth, dairy organizations desire a taxing and licensing law, similar to the filled cheese act. We most emphatically favor a taxing and licensing bill for governing the manufacture and sale of filled milk. The filled cheese law has stood the test, and why experiment with any other form of legislation?

The chairman of the Ways and Means Committee, Congressman Fordney, has informed us that he would welcome the opportunity to have his committee introduce a bill similar to the filled cheese law and would do all he could to have his committee report it favorably to Congress. It is our opinion that those interested in this legislation should support such a bill and be ready to appear before the Ways and Means Committee in its behalf. Making the filled milk bill a committee measure insures united support and more prompt attention.

This committee will dispose of the tariff bill in about three weeks and the committee will then take up the special revenue bills. At this time there will be opportunity to consider the filled milk bill.

The dairy interests must be ready to act, for our enemies are well organized and will do all they can to defeat this legislation. The dairy cow needs this protective legislation as she cannot compete successfully with the cocoanut cow of the South Sea Islands. Further, her product, milk, is our only protective food and there should be given no opportunity to sell a compound as milk. The consumer, as well as the dairy farmer, is entitled to protection against fraud and deception.

COLD STORAGE BILLS

There are several bills before Congress to regulate the length of time food may be kept in cold storage and how it shall be labeled and sold. The purpose of these bills is to prevent monopoly, to advise the consumer as to how his food has been handled, how old it is, and to protect those selling strictly fresh foods. This legislation is demanded by various women's clubs and those interested in protecting the public against fraud and excessive prices. For instance, when eggs are advertised by the grocer as fresh, they must have come direct from the hen to his counter and not from cold storage where they may have been held for several months. Fresh creamery butter must be that kind of butter and not cold storage goods.

The sale of certain cold storage foods may well be controlled, but there are no hard or fast lines which can be drawn between fresh products and cold storage. In the case of butter as soon as it is made it goes into a refrigerator and if properly handled is kept under refrigeration till sold to the consumer. It would be unfair to mark butter "cold storage" which has moved in a reasonable time direct from the creamery to the market. Some bills now before Congress are so phrased that all butter would have to be labeled cold storage if they are enacted into laws. This would be unfair to the butter industry.

It is plain that it will be necessary to put a time limit upon butter, that is, the number of days it may be held in storage before it will have to be marked cold storage. Here lies the difficulty. Butter properly made and held at the right temperature in storage may score quite as high when a year old as when placed in cold storage. A law to regulate the sale of storage butter because of the quality of such butter is not the main purpose of the bills before Congress. The real object is to prevent monopoly. Quality of butter does not depend so much upon its age as on the character of product from which it is made. A freshly churned butter may be poor while a butter that has been in cold storage for a year may be very good, may sell as an extra.

It seems to be the opinion of those who understand the marketing of butter that it should not be labeled cold storage till it is at least 60 days old. Others hold the better way would be to put the date of make on each package of butter and let quality, as it will, determine its grade and value. The age of butter does not determine its healthfulness and only to a limited extent its quality.

The purpose of governing the sale of storage butter is more of an economic question than of deception or wholesomeness. It would seem that a law which would permit the storing of butter for one year would be fair and would prevent holding butter for exacting undue profits. Since it is not a question of healthfulness or deception so much as it is a question of economics we believe butter should be at least 60 days old before it will be required to be labeled "storage". To require butter to be labeled "storage" earlier than 60 days would be a great injustice to the creamery industry and would accomplish nothing for the consumer. So far as the wholesomeness and deception is concerned, butter needs no storage law to govern its sale.

A Tuberculosis Symposium

A Western Reader Criticizes the Tuberculin Test. Three Scientists Reply

In a recent issue of Hoard's Dairyman you answer certain questions in regard to the tuberculin testing of dairy cattle. First question verbatim.

"When cattle are killed that are reactors to the tuberculin test do they find many that have no lesions?"

Answer: "Post-mortem examination of reacting animals will not ordinarily disclose lesions in more than 85 or 90% of the cows. This does not mean that the animal does not have tuberculosis, but merely that no observable lesion can be found. It is quite possible that the animal may be in the incipient stages of the disease, or it is quite possible that the lesion is so covered up, or is so small, that it is not ordinarily found with the examinations as they are made on the killing floor."

Is not this latter, to say the least, far-fetched, for frequently the veterinarian that has made the test makes a microscopic examination in post-mortem to prove the truth of his diagnosis. Your position is about the same as a judge before whom a person charged with some crime has been tried. The jury hear all the evidence, pro and con, and bring in a verdict of not guilty. The judge then disregards the verdict and sentences the prisoner on the theory that evidence to convict had not been adduced or had been covered up.

Under our law any person is presumed innocent until proved guilty, and the same should hold good with a dumb animal, but in this case, although the post mortem says she is innocent, you disregard the evidence of the post mortem and say she is possibly guilty. By all the rules of law she was innocent, or in other words perfectly healthy and should not have been killed.

Second Question. "Could the tuberculin in any way affect the cattle so they would react if they did not have tuberculosis?"

Answer: "The tuberculin will in no way affect cattle so they will react when free of the disease. There are people who fear tuberculin may communicate the disease to their cattle. That this is not possible is not only proven by many demonstrations, but also by the fact that the tuberculin itself consists of the dead disease germs and, therefore, will not communicate disease.

I claim the answer to this second question entirely misleading and incorrect. An overdose of tuberculin will cause a perfectly healthy subject to react. This is such a well known fact as to be beyond dispute.

Next. The injection of dead bacilli into a healthy cow will produce sterile abscesses and also produce tubercular lesions similar to those occurring after the injection with the living germ and will often lead to marasmus and other systemic

symptoms of poisoning. Further, when the tuberculin test is applied the *tuberculin can not distinguish between the lesions produced by dead bacilli and live bacilli.* How are you going to eliminate tuberculosis by the use of the tuberculin test when every time you test you are sowing the seed for a new crop of reactors? The plain facts are that the tuberculin test is the most colossal fraud ever perpetrated on the dairy interests of the country and, as all of its advocates know, will not bear scrutiny. It has been the cause of the slaughter of hundreds of thousands of perfectly healthy cows and has ruined tens of thousands of good, industrious, law abiding dairymen of this nation. It is utterly without merit and should be wiped from our statute books.

Washington. DONALD MCINNES.

Reply by Dr. Moore

My personal experience in testing and holding post mortems has been that very few animals that gave a reaction failed to show lesions. This is restricted, however, to the subcutaneous method of using tuberculin. My experience is similar to that published in Farmers' Bulletin No. 351, in which Dr. John R. Mohler states that the reports of the tuberculin tests made in the fifteen years from 1893 to 1908 by federal, state, and other officers with tuberculin prepared by the Bureau of Animal Industry show that lesions of tuberculosis were found in 98.39 per cent of 24,784 reacting cattle slaughtered. It is known that a small percentage of tuberculosis cattle have, at the time of slaughter, the lesions restricted to the nervous system, bones, or skin where they might not be detected on an ordinary examination. It is also believed that animals may be infected, but the tubercles that have developed are still too small to be seen by the unaided eye but yet lesions enough that may be microscopic in size have developed to enable the tuberculin to cause a reaction. I believe, therefore, that by the subcutaneous method of administering tuberculin there should not be more than from 1½ to 2 per cent of cattle that are tested by the subcutaneous method that fail to show lesions. For the reasons stated, the few animals that give a good reaction but do not show lesions should be considered tuberculous. When the reaction is suspicious, that is, within a possible physiological variation of the temperature, a good many of them are not infected. Professor Poles of Holland found between 40 and 60 per cent of the so-called suspicious cases to be tuberculous when they came from diseased herds.

More recently tuberculin is being administered by what is known as the intradermal and ophthalmic methods. The reports I have received from those who have employed these methods vary. Some are finding a very small, and others a very large, percentage of no-lesion cases. These methods do not appear to give the uniformity of results that were obtained in the past by the subcutaneous test. I have not had sufficient experience in the use of tuberculin by these methods to be more definite relative to their merits.

The second question is, "Could the tuberculin in any way affect the cattle so they would react if they did not have tuberculosis?" In my experience I have not found any evidence that tuberculin will cause healthy cattle to react. It has been suggested that when large doses of tuberculin are injected, the tissues may become sensitized so they would give what is known as an anaphylactic reaction if the animals were injected with tuberculin later. To my knowledge, this has not been demonstrated to be the case. A few animals have given a reaction to the subcutaneous test after failing to react in previous tests and on slaughter lesions were not found. These cases suggest an anaphylactic reaction although it has not been proven that tubercles in remote parts of the body or microscopic in size did not exist.

Tuberculin cannot infect an animal with tuberculosis. It is prepared from bouillon cultures of tubercle bacteria which have been heated to kill the organisms and then filtered through a Berkefeld filter to remove them. Tuberculin, therefore, cannot produce tuberculosis any more than "maple syrup can grow maple trees". Repeated injections of tuberculin do not mean "sowing the seed for a new crop of reactors" as stated in the letter.

The third question is relative to dead tubercle bacteria. When tubercle bacteria that have been killed by heat are injected into experimental animals they may produce lesions quite similar to those produced by living organisms, at least, insofar as the necrosis of the tissues is concerned. I have not, however, had experience in injecting dead bacteria into cattle or in testing animals that have been injected with dead bacteria with tuberculin. I am not able, therefore, to answer this question further.

The injection of tuberculin into infected animals is the surest way that is known to science of detecting tuberculosis in an individual and cattle owners can by its proper use determine the animals in their herds that are tuberculous if they use it properly and persistently. Tuberculin, however, has its limitations in that it sometimes does not produce a reaction where the disease is far advanced or when the lesions are arrested or encapsulated. It is not infallible but it is the best diagnostic we have for tuberculosis.

N. Y. Veterinary College. V. A. MOORE.

Reply by Dr. Mohler

In answering the question as to reactors showing lesions, the editor of "Hoard's Dairyman" has understated rather than overstated the facts. Since the beginning of the tuberculosis eradication campaign in the United States in 1917, thousands of animals that have reacted to tuberculin have been slaughtered and in approximately 92 per cent of these reactors the lesions of tuberculosis have been found. This does not mean that the remaining 8 per cent were not tuberculous. Let us remember that all diseases have a beginning. Tuberculosis starts as a minute point in some one of the organs or tissues of the body and it has been repeatedly shown that a tuberculous area the size of a millet seed is sufficient to cause cattle to give typical reactions to tuberculin. When the size of the bovine carcass is considered, is it to be wondered at that some of these small lesions are not found at autopsy? Think of the difficulty of finding a millet seed concealed somewhere in the various glands, in the lungs, in the liver, or perhaps beneath the skin, of a slaughtered cow!

I am in entire agreement with the editor of "Hoard's Dairyman" when he states that tuberculin will in no way affect healthy cattle so that they will react to the tuberculin test. It is hardly correct, however, to say that tuberculin consists of the dead disease germs because while tuberculin is obtained from the cultures of the disease germs, and while all the disease germs are killed so that there is no possibility of communicating disease through the tuberculin, the tuberculin itself is obtained by filtering off the dead disease germs and is a clear fluid which never causes abscesses and which can not render healthy cattle susceptible to a second injection. This last statement has been proved over and over again experimentally and through practical work in the field. Thousands of herds have been tested at intervals of from three months to one year over a period of many years without one single instance of healthy animals being rendered susceptible to the tuberculin test. This applies not only to small doses but to enormous doses of tuberculin which were administered in an experimental way and which are far greater than the doses administered in practical work.

It is an indisputable fact that tuberculosis annually causes millions of dollars loss to the farmers of this country and it is equally true that the tuberculin test is a wonderfully accurate method for detecting the presence of that disease. I believe that later, when Mr. McInnes has been more fully informed, he may be found among those who believe in the reliability of the tuberculin test and who insist upon its use to rid their herds of tuberculosis. J. R. MOHLER.

U. S. Bureau of Animal Industry.

Reply by Dr. Hastings

Before attempting to discuss the specific points mentioned in the letter of Mr. McInnes, it seems proper to present a few facts concerning bovine tuberculosis and its eradication from a herd or its exclusion from a healthy herd.

Any method to be used for these purposes must involve the detection of the tubercular animal. Such an animal is one whose body has been invaded by the tubercle bacillus which has succeeded in establishing itself in the tissues, and is growing there to the injury of the animal. During the early stages of the disease, the tubercle bacilli are so enclosed in the so-called "tubercles", which are an expression of the reaction of the tissues of the animal to the growing tubercle bacilli, that there is no opportunity for the bacilli to leave the body of the affected animal. It is, of course, evident that such an animal can not be a source from which other animals can acquire the disease. Sooner or later, however, the condition is so changed that the tubercle bacilli find opportunity to leave the body and now the animal in question becomes a source from which other animals may acquire the disease. It is proper to speak of it as an opportunity which is presented to the tubercle bacillus to leave the body of the animal in which it is growing; for under natural conditions this organism can grow only in the body of the living animal. This implies that unless it has some way by which it may leave the body of the diseased animal, and some way by which it may enter the body of still another animal, the race of tubercle bacilli will soon become extinct. Nature has been as careful to provide ways by which the tubercle bacillus can maintain itself, as she has to provide ways for the perpetuation of plants and animals. One marvels at the means she uses to fertilize the blossoms of the flowers, and just as marvelous ways have been provided for bringing disease-producing organisms in contact with fresh food.

It will be evident to everyone that our fight against bovine tuberculosis will be more successful if we have some means of detecting the disease before it reaches the stage in which the organisms are given off from the body of the animal than without such a means; for certainly if the animal can be detected and removed before this condition is reached, far less opportunity will be presented for the tubercle bacillus to find fresh pastures in the bodies of the still healthy animals of the herd. The tuberculin test is the only means at our disposal for detecting the disease before it has reached the stage in which the bacilli are leaving the body of the animal. It is the only weapon which we can use against this enemy that threatens our cattle.

It is idle to say that the test is a weapon by which each shell fired lands on the mark and explodes. Some "duds" there will be, but because there is one dud out of ten shells, shall we refuse to use shells in our warfare and stick to solid shot? The tuberculin test is not free from error. It probably causes the removal of some healthy animals from the herds. It certainly leaves, now and then, diseased animals in the herd; but by its use thousands of herds have been freed from tuberculosis, and many thousands more have been protected from this disease. It certainly gives at least nine successes to one failure. If we allow the failures to influence us to a greater extent than the much more numerous successes, we shall be making a mistake. Some who use the test are to have experiences that will lead them to believe that they would have been as well off without it, not better off however, while many others will be certain that it has been a great factor in their success.

Now to answer, if I can, the specific points raised by Mr. McInnes. We must select one method of determining whether an animal is tubercular. We can say that the test shall be our measure or we can say that the post mortem examination shall be the measure. If the answers conflict, who shall say which is right? It is clear that the only workable plan is to abide by the decision of the test, and disregard the post mortem. The test will certainly be justified by the post mortem in nine out of ten cases, and the remaining case may or may not justify the test.

Mr. McInnes is probably right in saying that an overdose of tuberculin will cause a reaction in a healthy animal. If he had been more definite and defined just what he had in mind, his statement would have been more valuable. There is no reason to believe that twice or ten times the normal dose of tuberculin will cause a reaction in a healthy animal. In other words, the tolerance of cattle for tuberculin is so great that the danger of making mistakes by overdosage is outside the bounds of possibility.

Mr. McInnes is also right in saying that dead tubercle bacilli will cause tubercles to form in the tissues of animals into which they have been injected, and that such animals might react to subsequent tuberculin tests. This again is something outside the bounds of possibility since the tuberculin contains none of the dead organisms. It contains the products formed by the tubercle bacilli as they grow in the beef broth of the bacteriologist. The methods of manufacture are such as to remove all of the dead organisms. As far as the writer is aware, no one has ever produced tubercles by the injections of the products of the tubercle bacillus. In fact tubercles produced by dead organisms have been noted, primarily if not solely, in small animals like the guinea pig and usually when the material injected contained a considerable amount of fat, and when the mixture of fat and dead tubercle bacilli was injected into the abdominal cavity of the animal.

Such letters as that of Mr. McInnes are of value since they cause some of us, who are attempting to supply clear statements in regard to the tuberculin test, to try anew and thus possibly come a little nearer our goal, which is such a complete understanding of the tuberculin test that each breeder and dairyman can make his own decision in regard to its use in his herd. E. G. HASTINGS.

Subscription Rates

Subscription in United States and Mexico $1.00 per year; 3 years, $2.00; Canada, $1.50 per year.

FOREIGN SUBSCRIPTIONS may be sent through news dealers and book sellers in all foreign countries.

All foreign countries in the Postal Union $2.50 a year; not in the Postal Union $3.00, including postage.

Correspondents must not expect us to acknowledge the receipt of letters containing remittance for subscription. The receipt of Hoard's Dairyman is sufficient notification that money has been received. The label on the paper will show date to which subscription is paid. In case of renewals, if date on label is not changed within two weeks after remittance is sent, inform us at once.

We solicit advertisements of meritorious articles needed by the farmer. We try to keep our advertising columns clean and wholesome, that they may merit the patronage and confidence of our readers. Unwholesome, immoral, and quack medical advertising are excluded. A sincere effort is made to exclude frauds, irresponsible and unscrupulous firms. We will always take it as a favor to be notified whenever any advertiser's dealings with a subscriber are in bad faith or evidence a lack of business honor. Advertisers generally recognize the readers of Hoard's Dairyman as an up-to-date class of farmers, who farm with business-like methods, and we hold our columns for the patronage of only those with whom our readers can deal with profit and satisfaction.

ADVERTISING COPY must be received eight days previous to the date of publication. Advertising to be classified or changes in advertising must reach us twelve days previous to date of publication.

Entered at Fort Atkinson, Wis., as second class matter.

Coming Events

Sept. 26-Oct. 2nd—Dairy Cattle Congress at Waterloo, Iowa.

Oct. 8-15—National Dairy Show at Minnesota State Fair Grounds. Manager, W. E. Skinner, 910 So. Michigan Ave., Chicago.

Pure-bred Cattle Statistics

The United States Bureau of Census credits Connecticut with 10,284 pure-bred dairy cattle, of which number 8,364 are females. The state is credited with 1,250 Ayrshires, 1,566 Guernseys, 4,859 Holsteins, 2,257 Jerseys, and 352 other breeds.

The state of Pennsylvania has, according to the census, 75,189 pure-bred dairy cattle, of which number 57,432 are females. By breeds, the classification shows 3,097 Ayrshires, 534 Brown Swiss, 9,618 Guernseys, 48,652 Holsteins, 11,036 Jerseys, and 2,252 other breeds.

Milk may be white but it helps put roses in the children's cheeks.

Oregon Jersey Jubilee

HOARD'S DAIRYMAN:—Enthusiasm, undismayed by the price of butterfat, coupled with a wide representation of lovers of the Jersey cow from all northwestern states as well as British Columbia, has made the third Oregon Jersey jubilee a decided success. This annual event which has now become a fixture in Jersey annals of the state, had its inception in the fertile mind of Professor P. M. Brandt, head of the Dairy Division of the Oregon Agricultural College, who conceived the idea that some fitting celebration should mark the completion and acceptance by the American Jersey Cattle Club of the wonderful record for production made at that time by Viva La France when she broke all previous records and produced on official test 1,039 lbs. butterfat in one year. The further fact that one-half the class leaders of the breed at that time had also made their records in Oregon seemed to afford plenty of excuse for a fitting celebration of the event. The thought crystalized in a tour of inspection of the various good Jersey herds of the Willamette Valley, much feasting and speech making on the way and a general "get together" occasion lasting three days. The initial trip was so fruitful of results that it was unanimously decided to make it an annual event.

The second jubilee was practically a repetition of the first, the territory embraced being entirely within the limits of the Willamette Valley. This year it was decided by the executive committee of the Oregon Jersey Cattle Club to carry the tour into new territory and the Tillamook district was decided upon as the object of their visit. Assembling at the farm of F. E. Lynn in the Willamette Valley, the home of Poppy's Dortha, the junior 3-year-old breed champion, with a record of 17,804 lbs. milk and 994 lbs. fat, the caravan of about fifty auto loads of enthusiasts moved west over the Coast range of mountains and down into the valley of the Tillamook, made famous by the cheese that bears its name. The trip of eighty miles was made in about five hours with stops at various modern cheese factories that lie along the route.

On arrival at Tillamook, a banquet was served at the Elk's Club rooms followed by talks from the visiting breeders. Friday's program included an inspection of the various pure-bred herds of the Valley. The dinner served by the ladies at Fairview Hall at noon to some five hundred visitors will long be remembered by all who partook of it. Returning to Tillamook in the evening, the day was closed with a rousing evening meeting at the gymnasium. The jubilee closed on Saturday with a gigantic clam bake on the beach, which seemed a fitting climax to an event that leaves only pleasant memories of the generous hospitality of a prosperous community whose wealth has been almost entirely derived from the dairy cow.

This fertile little valley nestling among the high hills bordering the Pacific ocean is a striking example of the prosperity that follows a successful co-operative effort. For a great many years the community was an isolated one without transportation other than by water. A treacherous coast at certain seasons of the year made even that more or less uncertain. The early settlers with their cattle were thus forced into the cheese making industry because this dairy product could be taken out over the mountains by wagon or pack horse. Their early product was of extra quality and met an eager demand in the outside market. From a small beginning, their output has steadily increased until today there are twenty-nine factories in the county with a total output in 1920 of nearly six and a half million pounds of cheese valued at over two million dollars. The average price returned to the producer for butterfat during the year 1920 was 71.63 cents per pound or $2.93 per 100 lbs. of milk.

When County Agent Roy C. Jones came to Tillamook in March, 1914, and started a campaign for better dairy cattle, there were three herds with pure-bred Jerseys. Today, there are over eighty herds of pure-bred Jerseys and 207 pure-bred Jersey sires in service in the county. Cattle graze the luxuriant pastures in the bottom lands practically twelve months in the year, thus affording heavy production at a minimum of cost. The bottom lands have a carrying capacity of a cow per acre while the higher or bench lands will carry one cow for each 1½ acres.

By the use of pure-bred bulls and the rapid increase of pure-bred females, the average yearly production of butterfat per cow is steadily increasing. While Register of Merit testing is comparatively new, the Valley expects to add three gold medal cows to their list this year. The jubilee was a decided success, not alone for its benefit to the Jersey breed but the dairy industry as a whole has surely been advanced in the Tillamook Valley.

Taylor Christgau Dispersion

Taylor & Christgau held an exceptionally successful dispersion sale at Owatonna, Minn., June 16. The 64 head offered brought an average of $330, a very good figure if one considers the lack of high record or exceptionally valuable stuff.

Ravenswood Bess Ormsby, an 18-lb. 2-year-old daughter of S. P. O. M. 41st was easily the best thing in the sale. She would in fact have been a credit to any sale, and P. O. Holland buying for St. Olaf College had enough competitors who wanted her, to force him to $1,325, top price of the sale.

Mack, Krause, and Hanson did the selling with Secretary Scott in the box.

The following list includes those animals selling for $300 or more and buyers:

M. L. Nelson, Minnesota	
Sir Ormsby Hengerveld Segis	$610
A. W. P. Piebe Longfield Burke	590
J. P. Peltz, Minnesota

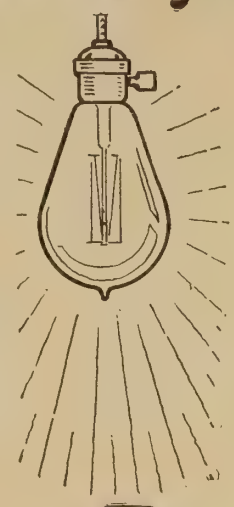
Tariff on Dairy Products

On the basis of the difference in cost of production in foreign countries and competing sections of the United States, the dairy tariff committee of the United States Milk Producers' Federation states that the following rates of tariff on dairy products are necessary:

Milk 3½ cents per gallon; cream 35 cents per gallon; butter 10 cents per pound, cheese 5 cents per pound, condensed milk 2 cents per pound, casein 5 cents per pound.



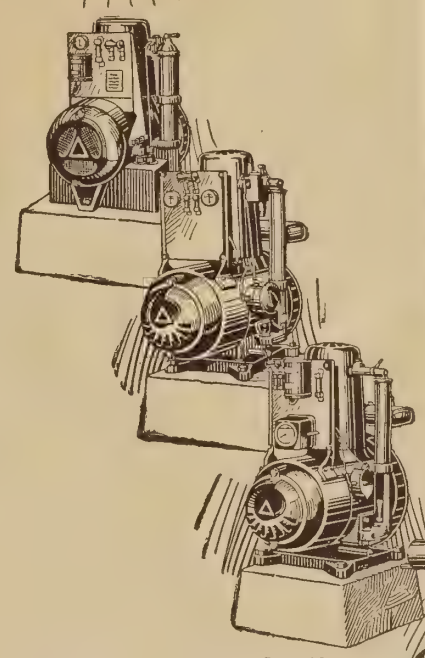
In support of these recommendations the committee also cites investigations as to costs of production made in several sections of the United States and in Canada and Denmark. It finds, for instance, that the average United States cost of producing 100 lbs. of milk in April, 1921, was $2.80; whereas costs in Canada for the same month were $2.37. This is a difference of 43 cents per hundred, or 3.7 cents per gallon. If New England costs were considered, the difference would amount to 4.1 cents per gallon.

Like comparisons were made in regard to costs of other dairy products. Butter, for instance, costs 10c a pound less to produce in Canada than in the United States while the costs in Denmark give the producer there an advantage 15 to 19 cents a pound. The ocean freight rate from Denmark to New York is only 2½ cents a pound while the Wisconsin and Minnesota producers will pay about the same to deliver their product in New York.

The committee favors a specific duty in preference to an ad valorem duty, that is, a specified number of cents per pound or gallon rather than a percentage duty on the valuation of the imported product. It believes such a duty to be easier of administration. It also asks for a tariff of 10 cents a pound on vegetable oils, or the same as that on butter for which it is used as a substitute. The importation of vegetable oils used largely in the production of substitutes for butter and other milk products increased from 82 million pounds in 1912 to over 435 million pounds in 1920. The importation of the past year replaced the equivalent of over a million cows or 7 per cent of the total cows in the United States.

The dairymen of the United States are under a deep obligation to the National Milk Producers' Federation for its careful survey of the tariff situation and its presentation of the needs of dairymen to the Ways and Means Committee of Congress. Its investigation represents the expenditure of a no small sum of money and time, and is the most exhaustive of anything that has been done to the present time in relation to the tariff on dairy products. Persons desiring copies of the complete report may doubtless secure them upon application to the National Milk Producers' Federation, 1731 Eye St., N. W., Washington, D. C.

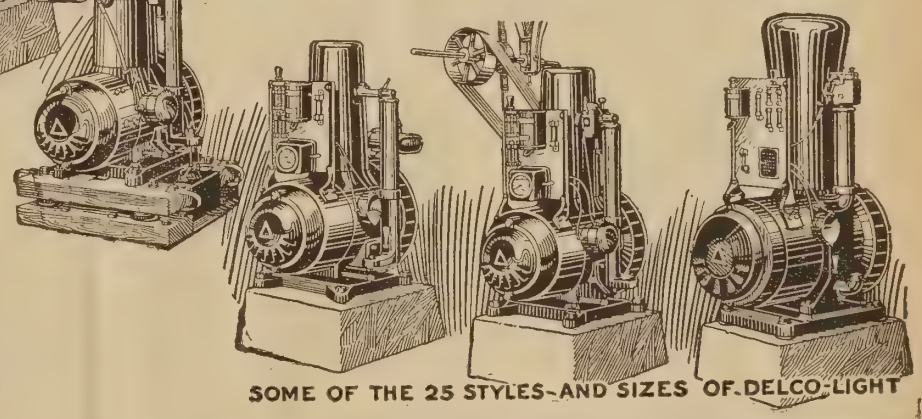
Choose the DELCO-LIGHT that fits your needs — and install it now



You can now get a Delco-Light Plant that exactly fits your needs—at a rock-bottom price.

Delco-Light will bring to your home a flood of electric sunshine—relief from the work and worry and danger that go with old-fashioned lamps and lanterns.

Delco-Light will help you and your family. It will lighten your burdens. It will furnish the current to do your chores; pump the water; milk the cows; separate the cream and in other ways bring happiness and contentment to farm life.



Find out what Delco-Light will do for you—how little it will now cost you—and how it will pay for itself over and over again. We will gladly send you a catalog showing the many models of Delco-Light and explain our plan whereby it can be bought on payments if desired. Write now for details.

Minnesota Guernsey Breeders Sell

Minnesota Guernsey breeders held a very successful state sale at the Fair Grounds, St. Paul, June 14th. It was a well managed, well attended sale of good cattle that brought fair prices—50 head averaged $336. The evening previous to the sale about 30 of the breeders attended a very enjoyable banquet at the Hotel Radisson. Instead of the usual long, tiresome program it was featured by short informal talks by members and breeders present.

The sale itself was a good example of the fact that even under present conditions good individuals backed by productive breeding can be sold at a profit, yearling heifers bringing as high as $500 and $600.

Geo. E. Richardson topped the sale with a two-year-old daughter of Bob Rilma's Monogram from a 542-lb. granddaughter of Gov. of the Chene. She was a splendid individual and bidding was brisk from the beginning. R. N. Bruer, Minnesota, bought her for $875.

An excellent daughter of May King of Linda Vista, with 561 lbs. fat in Class C consigned by Jean Du Luth Farms, took second place in the price list going to Radisson Farm for $840.

Love, McGuire, and Benjamin did the selling with F. E. Fox in the box. Sec. L. V. Wilson managed the sale.

The following list includes all animals bringing $300 or more and buyers of the same:

R. E. Coussens, Minnesota	
Lucretia's Emerita of Glenhurst	$300
F. A. McCortney, Minnesota	
Gemsey of Echo Farm	$305
A. H. Ehlers, Minnesota	
Aspara 2d	$345
Ben Schafer, Minnesota	
Little Eva of Roadside Farm	$300
University of Minnesota	
Sunny Cora of Roadside Farm	$500
St. Croix Chloe	600
J. O. Jacob, Wisconsin	
Imp. Gay Lad's Cupid of Iowa	$305
F. R. Cort, Wisconsin	
Mazie of Bon Ayre	$345
Hoffman Bros., Minnesota	
Juanita of Peacevale	$325
W. E. Harrington, Wisconsin	
Pride of Lone Elm	$325
Rouge Nancy of Jean Du Luth	325

Association Notes

North-Branch, Pennsylvania:—During May market milk sold for $3.38 per cwt. Milk retailed for 11½c per quart; butter, 50c per pound, and cheese, 28c. Corn silage sold for $6 per ton; mixed hay, $18; ground oats, $29; corn and cob meal, $21.50; cottonseed meal, $42.50; linseed meal, $51; pasture, 10c daily.

Washington County, Vermont:—Every farmer in the association now owns a pure-bred registered bull. All herds except two have been tuberculin tested and these owners have applied for test. Nearly all farmers are feeding grain through the summer months. The creamery paid 40—50c per pound for fat. Milk retailed for 12c per quart and butter for 37c per pound. Bran was priced at $1.50 per cwt.; corn meal, $1.65; ground oats, $1.90; cottonseed meal, $2.25; linseed meal, $2.15; gluten, $1.95; hominy, $1.70; Unicorn, $2.30.

Wilton, Wisconsin:—Several cows were condemned to go to the block having indications of not being able to produce at least 250 lbs. butterfat per year—our standard. June 5th we conducted our first inspection tour in the vicinity of Tomah and Wilton-Monroe County. There are nearly 50 cows in the association eligible to Register of Production. No scrub bulls are used. The creamery paid 54c per pound for fat. Wheat bran cost $21 per ton; alfalfa hay, $30; mixed hay, $12; oats, 30c per bushel; barley, 60c; shelled corn, $1.25 per cwt.

Fairfax County No. 1, Virginia:—Two unprofitable cows were sold to the butcher and one new member was secured. Several members are feeding home mixed rations. Very satisfactory home mixed rations can be made for from $10 to $15 less per ton than the price of ready mixed dairy rations. The record cow for the month bred by Mr. Bready has produced during the last three months 6,405 lbs. milk containing 252.24 lbs. fat. Market milk sold for $3.25 per cwt. during May. Milk retailed for 14c per quart. Larro sold for $48—$50 per ton; cottonseed meal, $45; linseed oil meal, $50; bran, $38; corn meal, $28; wheat middlings, $50; beet pulp, $44.

Darien-Sharon, Wisconsin:—Three young Holstein bulls were purchased this month. Three poor producing cows were sold for beef; one pure-bred Guernsey cow sold for dairy work; 1 new cement silo is being erected; 3 sets of drinking cups are ordered. Pastures are poor. Plans for a pure-bred calf club among boys and girls of this association are well under way. We are doing some real work in this association because Tester Geo. Moss got every member to pledge against the use of oleo. Market milk testing 3.5 per cent sold for $2.05 per cwt. Four cents were paid for each point above. Milk retailed for 10—12c per quart and butter for 39c per pound. Alfalfa cost $18 per ton; mixed hay, $10; oil meal, $50; oats, $32; silage, $6; bran, $24; middlings, $22; corn, $25; oil meal, $52; pasture, $2.

Moscow-Center, Wisconsin:—A carload of feed was bought with an estimated saving of $250. Members are learning the advantages of summer grain feeding. Every member has a pure-bred bull which is a good start for a new association. During May, market milk testing 3.5 per cent sold for $1.50 per cwt. The creamery paid 31c per pound for fat. Oil meal was quoted at $38 per ton; cottonseed meal, $40; hominy, $25; bran, $22; oats, $30; corn, $25; silage, $7; alfalfa, $18.

Southern Franklin County, Pennsylvania:—During May, market milk sold for $2.50 per cwt. and 21c per gallon. The condensery paid 35c per pound for fat, and in addition 50c per 100 lbs. milk; the creamery paid 40c per pound for fat; the cheese factory, 35c. Milk retailed for 10c per quart; butter for 25c per pound, and cheese for 24c per pound. Feed prices: Union Grains, $46 per ton; bran, $40; corn and cob meal, $20; cottonseed meal, $42; oil meal, $45; hay, $15; stover, $6; silage, $6; oats, 70c per bushel; pasture, $3.

Delaware County, Ohio:—Four unprofitable cows were sold this month. More members are feeding grain with pasture this year. Market milk testing 4 per cent sold for $1.95—$2.35 per cwt.

Central Berkshire, Massachusetts:—Every herd in the association has a

pure-bred registered sire. Several members that always bought ready grain rations are now mixing their own and saving money. Milk wholesaled at 7c per quart. Linseed cost $2.60 per cwt.; cottonseed meal, $2.25; middlings, $1.65; corn meal, $1.60; ground oats, $2.18; gluten, $2.25; hay, $25 per ton.

Allen-Putnam, Ohio:—Fifteen pure-bred bulls are among the herds. Six cows here sold over the block. There are 7 milking machines in the association but only 3 are in use. The condensery and creamery paid 25c per pound for fat. Milk retailed for 10c per quart; butter for 25c per pound, and cheese for 20c. Corn and oat chop was quoted at $20 per ton; cottonseed meal, $34; oil meal, $35; silage, $8; bran, $1.75 per cwt.; middlings, $1.75; silage, $8.

DuPage County, Illinois:—One member put his herd under federal supervision, and had his first test during the past month. Eleven reactors were found. Another herd under federal supervision passed the first clean test. Five herds are now under federal supervision. Eight unprofitable cows were sold during the month. Market milk testing 3.5 per cent sold for $2.05 per cwt. Milk retailed for 14c per quart and butter for 35c per pound. Corn sold for $21 per ton; oats, $24; barley, $29; hay, $25; silage, $6; bran, $22; oil meal, $42; cottonseed meal, $34; gluten, $33.

Loudoun Valley, Virginia:—Five unprofitable cows were sold and an increase in production of 11,276.7 lbs. of milk and 636.1 lbs. fat was made over last month's production. Market milk sold for 24c per gallon. There are no condenseries, creameries, or cheese factories in this community—about everybody ships to Washington City. They received $1.35 for 20 per cent cream and 81c for butterfat in May. Bran cost $35 per ton; cottonseed meal, $36—$40; mixed grain, such as Unicorn and Larro, $42—$45; alfalfa hay, $20; clover and mixed hay, $16—$20; pasture $2.50.

First Bedford County, Pennsylvania:—Nine unprofitable cows have been sold during the month. Sixteen members own pure-bred sires. Two members have signed up to go in the accredited herd work. Market milk sold for $2.86 per cwt.

Cheshire County, New Hampshire:—There are 5 grades to each pure-bred in the association, nevertheless nearly one-half of the honor roll cows for May were pure-breds. Market conditions in this section are poor. Whole milk testing 3.5 per cent brings the farmer from 2½ to 10c a quart at the farm, the average return being about 4c. A good salesman can retail high grade butter for 30 cents, but the average farmer can't unload his product and realize any profit.

Lake County, Illinois:—A splendid bred herd sire was purchased and also two grade Holsteins were purchased. G. R. White sold 17 grade Holsteins at auction for an average of $155 per cow. That goes to show it pays to test. During May, market milk sold for $2.05. Silage sold for $6 per ton; hay, $18—$20; corn and cob meal, $16; ground oats, $22; ground barley, $24; oil meal, $40; cottonseed meal, $40; bran and middlings, $22.

Skagit Valley, Washington:—Two new silos are being erected by members who had none. This makes 25 silos on the farms of our members. Market milk sold for $1.90 per cwt. during May. The creamery paid 44c per pound for fat. Milk retailed for 11c per quart.

DeKalb County, Illinois:—This association numbers 24 members. The total milk for the association has a value of $66,853.70, which is but a small part of the total dairy products of DeKalb County. To Walter Hulmes goes the credit for the most economical production of milk for the month. This was made on pasture with a well balanced grain ration. Fox & Arison had their herd tuberculin tested this month and their herd was found clear of the disease. A motto: Think right, get right, and then all get together and boost.

Claremont—Lebanon, New Hampshire:—Farmers in the vicinity of Claremont expect to do federal accredited herd work. Market milk testing 3.7 per cent sold for $2.25—$3.50 per cwt. The creamery paid 55c per pound for fat. Milk retailed for 12c per quart and butter for 45c per pound. Bran was sold for $34—$37 per ton; gluten, $45; cottonseed meal, $41—45; linseed meal, $40—$50; ground oats, $35—$45; corn meal, $33—$35; mixed hay, $20.

Porter County, Indiana:—Two unprofitable cows were sold and one pure-bred Holstein cow was purchased. Milk sold for $2.05 per cwt. during May. Milk retailed for 11c per quart. Feed prices: Clover hay, $14 per ton; alfalfa $15; corn meal, $21; corn and cob meal, $18; bran, $25; oats, $23; cottonseed meal, $38; oil meal, $42; gluten feed, $29. The month of May concluded the present testing year but the reorganization is nearly complete and the Porter County dairymen will still continue the work of improving their already excellent herds.

Hancock County, Ohio:—This association has just completed a very successful year's work, climaxing the whole thing by placing sixty cows on the "Quality List" for the month of May. The requirements for the "Quality List" are 1,000 pounds milk or 40 pounds butterfat in a month. There were less than 150 cows on test.

Two Dollar BROWNIE

THE BROWNIE CAMERAS of the box type are the simplest of all cameras to load and to use. But what is even more important, they are well made and carefully inspected, have good lenses and make *good pictures.*

THE No. 0 BROWNIE makes pictures 1⅝ x 2½ inches. It has an excellent meniscus lens, a shutter for snap-shots or time exposures, has two finders and is handsomely finished. Kodak film cartridges for 8 exposures to fit this Brownie are but twenty-five cents. In every detail a practical little camera. Inexpensive to buy and inexpensive to use.

The No. 0 Brownie.
The Price, $2.00, includes the excise war tax.

Ask your dealer or write us for a catalogue of Kodaks and Brownies.

EASTMAN KODAK CO., ROCHESTER, N.Y.

FILTER YOUR MILK

THE CHAPMAN STRAINER AND FILTER COMBINED

will remove dirt, hair, bacteria, blood corpuscles and other substances which a strainer only cannot catch. This will greatly improve the quality and flavor of the milk and prevent it from souring quickly. It can be quickly taken apart for cleaning. Price each $2.50. Postage 30c extra. Cotton and gauze at extra prices here given. Dairy Special Sterilized Cotton 50c a lb.; in lots 25 lbs. or more, 45c.
Dairy Special Sterilized Gauze 8c a yard; in lots 100 yards or more, 7c a yard.

THE AUTO-OILED AERMOTOR

A Real Self-Oiling Windmill

A year's supply of oil is sent with every Aermotor

Oil an Aermotor once a year and it is always oiled. Every moving part is completely and fully oiled. A constant stream of oil flows on every bearing. The shafts run in oil. The double gears run in oil in a tightly enclosed gear case. Friction and wear are practically eliminated.

Any windmill which does not have the gears running in oil is only half oiled. A modern windmill, like a modern automobile, must have its gears enclosed and run in oil. Dry gears, exposed to dust, wear rapidly. Dry bearings and dry gears cause friction and loss of power. The Aermotor pumps in the lightest breeze because it is correctly designed and well oiled. To get everlasting windmill satisfaction, buy the Aermotor.

DAIRY MAKRET NEWS

Butter Markets Active

(Report by U. S. Bureau of Markets)

The trend of the butter markets during the week ending June 18 was similar to that of the previous week. Out-of-town buyers, particularly at New York and Chicago, have been regular factors on the market taking some of the best lots for storage.

While the most active trade is, of course, along lines of fancy creamery and fine centralized cars which are being taken chiefly for storage, the cleaned up condition of the markets on undergrades is rather remarkable and is worthy of more than passing notice. This is probably due in part to purchases of undergrade lots by buyers who want to obtain cheaper butter and thus avoid following the advance of the market on top grades, but it is also due to the fact that the quality of arrivals has been so good that the offerings of undergrades have been far short of the usual June showing. One market at least has commented on this for several weeks past, even going so far as to state that the butter arriving is better than has been seen for several years.

Neither reports from producing sections nor market receipts indicate any falling off in the make as yet. Some sections do, of course, show a shrinkage but more show an increase.

The average wholesale prices on 92-score butter at five of the principal markets for the week ending June 18, 1921, and the corresponding week a year ago were as follows:

	Week ending June 18 1921	1920
	Cts.	Cts.
New York	32.8	57.5
Chicago	32.2	55.2
Philadelphia	33.2	57.7
Boston	33.8	57.9
San Francisco	33.5	54.9

The receipts of butter at these markets were 18,737,420 lbs. as compared with 16,028,266 lbs. a year ago and 18,543,918 lbs. a week ago.

Cheese Markets Steady

[Report by U. S. Bureau of Markets.]

Cheese markets maintained a good healthy tone during the week ending June 18, but on the whole trading was not quite as active as the previous week. Consumptive demand was good, and many dealers were still looking for fine cheese suitable for storing, although buying of the latter type has been done with more or less caution on account of losses incurr the past two years. Regardless of this, ho ever, storage holdings at the four large who sale markets have shown a steady increa and are already some 4,000,000 lbs. heavi than a year ago. The total holdings in t United States on June 1, according to the r port just released, amounted to 17,767,752 lb as compared with 13,400,000 lbs. last ye 12,400,000 lbs. in 1919, and 20,395,000 lbs. 1918.

Wholesale prices on the Wisconsin chee boards Monday, June 13, were mostly u changed except in the smaller styles which a vanced an average of 1c. Young Americ have been especially in demand. At the clo of the week, business at Wisconsin prima markets had become lighter, and some shadi of prices were taking place.

The average wholesale prices on Americ cheese (style twins) for the week ending Ju 18, 1921, and the corresponding week a ye ago were as follows:

	Week ending June 1921	19
	cents	cen
New York	15.5	28.
Chicago	14.7	25.
Boston	16.2	27.
San Francisco	16.0	28.
Wisconsin	13.7	24.

The receipts of cheese at these markets we 4,987,793 lbs. as compared with 4,344,334 lbs. year ago and 5,334,145 lbs. a week ago.

CHICAGO, June 24—Butter—Creamery, e ras, 32c; extra firsts, 32½c; dairy, first 28½c; seconds, 24@27c.

Straw:—Receipts continue light, but the tone of the market appears to be a little weake than last week. Prices are practically unchanged and are quoted as follows: Wheat straw—Philadelphia $17.50, Pittsburgh $13.50, Cincinnati $11, Chicago $11.50, Minneapolis $9, Kansas City $9; oat straw—Philadelphia $18, Pittsburgh $13, Baltimore $16, Cincinnati $11, Chicago $12, Minneapolis $10; rye straw—New York and Philadelphia $25, Baltimore $22.50, Cincinnati $17, Chicago $15, Minneapolis $10.50. Quotations for rye straw in eastern markets are usually for straight untangled straw baled in box presses.

Dodge County Picnic

The big Dodge County Holstein picnic held at Horicon, Wisconsin, June 19 proved a winner in every respect. About twenty-five hundred people turned out for the occasion. A masterful address was delivered by Ex-president D. D. Aitken of the National Holstein Association. Mr. Aitken, among other things, urged the importance of organization and dwelt at some length on the merits of the black and white cow.

Wisconsin. F. DARCEY.

A long ladder is a piece of farm equipment which will pay a good dividend in convenience.

Krause's Annual Sale Averages Well

W. H. Krause, Wisconsin, held his first annual bred heifer sale June 9 in the face of unusually poor business conditions but in spite of them held a very satisfactory sale, the 63 animals offered bringing an average of $250.

Buyers from four different states were present. Limbeck & Hultgren, Iowa, were the heaviest buyers taking fourteen head for just short of a $270 average. Minnesota, Montana, and Wisconsin were also represented.

Anton Baldeschwaler, Wisconsin, paid the top price of the sale, $450, for an excellent 4-year-old granddaughter of Sir Johanna Piebe, from a 26-lb. dam. The heifer sold with her calf at foot.

Mack, Hanson, and Krause did the selling with Scott and Everson in the box.

Following is a list of those animals selling for $300 or more and buyers:

A. H. Heckler, Minnesota	
Homeside Pietertje Ormsby	$405
C. W. Bush, Wisconsin	
Johanna Calmia Ormsby	$400
Homeside Queen Pietertje	400
Limbeck & Hultgren, Iowa	
Thorla Tolita Duchess	$300
Clover Hill Hengerveld Rozena	355
Vesta Netherland Hartog Colantha	355
John Barth, Wisconsin	
Homeside Tolita	$390
Lilith Mercedes Bess	390
Elmood Segis De Kol	350
Allen Odegard, Wisconsin	
Homeside Pearl De Kol	$310
Anton Baldeschwaler, Wisconsin	
Johanna Homestead Piebe Watson	$450
Chas. Sigglekon, Wisconsin	
Clover Hill Vesta Colantha	$365

Handles Over 600,000 Pounds Cheese

The Wisconsin Cheese Producers' Federation received at its Plymouth warehouse for the week beginning June 6th, 523,333 lbs. of cheese. Besides this, the Federation is now receiving at its Spring Green branch more than 100,000 lbs. per week. This is more cheese than the Federation has ever received before in one week during any time since its organization, and for all of this cheese the management finds a ready sale.

This certainly does not look as if the Federation is losing out, as its enemies so freely predicted it would do when it adopted its new financing plan several months ago.

The new financing plan under which the Federation members finance their business by deferring payments a short time is working out very satisfactorily, much better than we thought it would. So far since adopting this plan farmers have been obliged to wait only about ten days longer on the average for their money than they formerly did. Before this plan was adopted patrons of cheese factories both in and out of the Federation usually received the money for their April milk anywhere from the 18th to the 25th of May. This year under the new plan the Federation advanced to its members on about the 20th of May about half of the money they had coming for April cheese. The balance of the money they had coming for April cheese was sent to the factories between the 7th and 10th of June, making on the average less than ten days longer that they had to wait for their money than they formerly did. In other words, the farmers have financed their business and saved more than $10,000 interest a year by waiting only about fifteen days longer for half of the money they received for the previous month's milk.—Wisconsin Cheese Producers' Federation.

Holstein Men Called in Conference

Those interested in the recent stormy session of the National Holstein Breeders' Association in Syracuse, when there was so much discussion over policies, will be interested to note that the newly elected president of the association, Ex-governor Frank O. Lowden, of Illinois, has called a conference of prominent breeders of the East in Chicago. The following will be present in the conference: A. L. Brockway of New York, W. C. Newman of Pennsylvania; F. M. Peasley of Connecticut, H. C. Reynolds of Pennsylvania, T. E. Elder of Massachusetts, and George E. Stevenson of Pennsylvania.

These men were prominent in securing a policy of retrenchment of expenses and in Mr. Lowden's election. The conference is believed to be a sign that Mr. Lowden will accept the office. It is thought that the meeting is to determine whether unified support can be expected in the future work of the association. Fundamental problems of importance will come up for discussion at the conference.

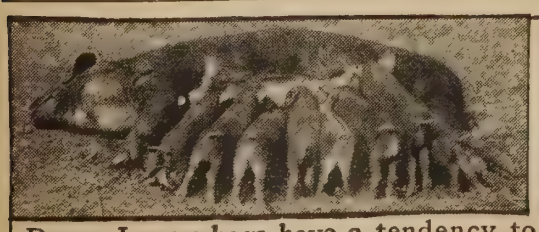
Dryden, N. Y. E. F.

Barron Co. Guernsey Sale

Guernsey breeders of Barron County, Wisconsin, held a very satisfactory sale of grade females and registered bulls at Barron, May 31st, with prices ranging up to $215. J. W. Sauk of North Dakota was one of the heaviest buyers, taking 12 head to complete a carload shipment.

Johnson of Iowa did the selling with G. R. Ingles in the box.

"Did you ever stop to think," said the farm philosopher, "that the farmer is practically the only producer who does not set a price on his product?"



The Profitable Hog

Hampshires dress out a higher percentage of high priced meat with a less percentage of lard. Hampshires are the most economical pork producers—the most profitable for you.

Write for information regarding them.

AMERICAN HAMPSHIRE SWINE RECORD ASS'N.

MORE PORK IN LESS TIME

Duroc-Jersey hogs have a tendency to put on great amounts of pork at an early age. They are easy-feeding animals, and raise large families. These hogs were introduced less than 50 years ago, and yet in 1918, 51% of all the hogs marketed in the country were "Duroc-Jerseys." They are uniformly red in color. Increase your profits by raising Duroc-Jersey hogs.

Write for "DUROC-JERSEY HOGS ARE PROLIFIC AND PROFITABLE"—sent free to hog-raisers by the largest swine record association in the world. Over 12,000 members.

The National Duroc-Jersey Record Association. Dept. 300 Peoria, Ill.

FEED UP

An important message to every Dairyman—

HAVE you stopped feeding since the flush of grass has been on?

It is a great temptation to cut down heavily on your grain ration in the early summer when pastures are good. Don't do it.

The prosperous dairyman stops feeding for only a short time and gets the best results by light summer graining when growing feed is plentiful. In this way your cows will be kept up to condition, and will be equal to any demand put upon them in the way of heavy feeding during the winter months.

For summer feeding get a supply of *Buffalo Corn Gluten Feed* and mix two parts with one part of wheat bran, or one part of ground oats.

For every four pounds of milk feed one pound of this mixture. Watch the condition of your herd and the satisfactory amount of milk they give.

Buffalo Corn Gluten Feed, which is a straight corn feed, contains the most nutritious parts for animal feeding. It will solve your feed problems for you.

Feed up—with *Buffalo Corn Gluten Feed!*

HOARDS DAIRYMAN JUNIORS

A DEPARTMENT FOR THE DAIRY FARM BOY

The Race Through the Corn Field

"Guess we won't quite finish this job today," said Jerry as he pulled his sweating, panting team up to the inviting shade of the gnarled, old oak that had guarded the rights of the Green line fence for the past fifty years or more. Jimmy had already stretched himself full length on the grass, and in answer to his brother's comment, he said, "I don't intend to finish to-day, and I guess if we did, it would be the finish for us and the horses too. Gee whiz, isn't it a scorcher! Hot enough to boil eggs," and he wiped his dusty hands across his hot, sunburned brow, leaving it streaked with mud.

"You're right, Jim, it is some hot! If I had gone on much longer, old Pete here would have dropped in his tracks," and he stroked the hot, belching nose of his favorite horse.

"Well, there's another day coming," said Jimmy and I guess cultivating corn is just about as good a job one day as it is any other. It's just eleven o'clock now," he added, "and that means that we stay right here until noon. These horses have done enough work for one-half day and I feel the same way about it too. So there you are and consequently I have declared 1-24 of a holiday for just an hour's rest." And he grinned up at Jerry a grin of careless mischief which the latter returned with a face filled with seriousness.

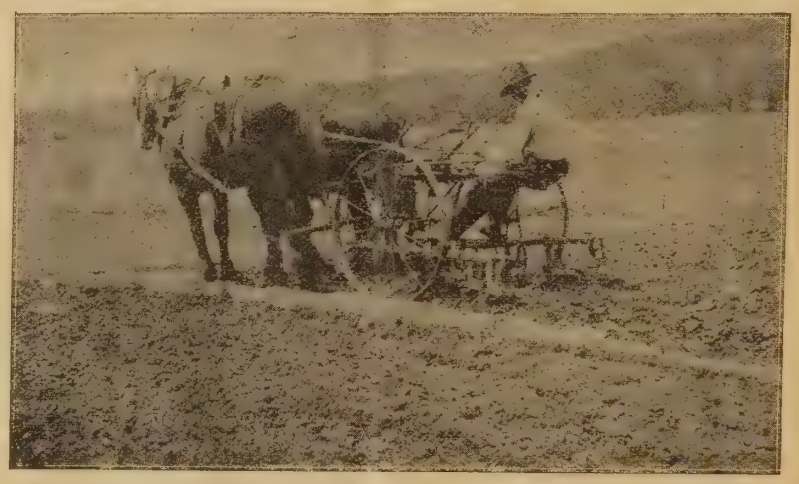
To Jerry this much time for rest was wasteful and this he made known in about as many words as would convey the idea, adding "and dad won't like it either."

"That isn't any cause for worry," Jimmy laughed. "Dad isn't doing this job and he's not in any position to say how hot it is. No, sir, this hour is for rest, a well earned rest," he emphasized "and we're going to take it. If dad would prefer four dead horses —well, that is what he would have if we continued to work under the heat of this sun. Use your head, Jerry, and don't worry about what dad will say. That's the trouble with people, they don't do enough real original thinking; too dependent upon what others say. If I had to name one important thing that my first two years at college have done for me, I would say that they have taught me to think."

"That's all right for you to talk that way," Jerry interposed, "but if you were working alongside of dad day after day, you'd know that his way of doing things is the best way, and even if you did think differently, you'd keep still about it in order to keep the peace. It's quite different with you though," he confided. "Dad looks up to you some now that you have been away to college and he's half inclined to believe that most of what you say and advise is true. Any way he knows that he is doing quite different on this farm now compared with the past. He's got things running more on a business basis and I really think that he is studying his problem and that is how to get the most from the labor and capital that is operating this place."

"Oh, pshaw, Jerry," he exploded. "Get it out of your head that dad looks up to me. He treats you just as good as he does me. You are to blame yourself if things do not go to suit you. If you produce the goods, dad will be O. K. on everything you suggest. I know he is one of the 'show me kind' and I think that is one of his strong points. He doesn't go off half cocked on every new idea that completely takes possession of many people. You know, Jerry, there is an old saying that runs something like this: 'be not the first by which the new is tried, nor yet the last to lay the old aside', and I must say that dad is practicing that to good advantage."

"Well, things are lots different than they used to be, that I'll admit," answered Jerry. "But just wait, Jim, until you and I get to running the old farm, then you'll see more changes that are real changes," he burst forth in boyish anticipation. But Jimmy did not enthuse over the idea and Jerry was quick to notice that. In fact, as he sat there moving the levers of the cultivator back and forth, he noted that Jimmy did not even make a reply which was entirely out of the ordinary for him, especially when things were mentioned that concerned him.



"What ails you anyway, Jim, you don't act the same as you used to," Jerry broke forth again somewhat disappointedly impatient. "You act just as though college is spoiling you. Anyway you haven't been the same since you've been home this time. You don't care to talk about the plans for the future the way we used to. Are you really stuck up about going to college or are you love sick?" he concluded abruptly.

"Nonsense," he replied, and the tired look in his steel grey eyes gave way to their usual brightness as he straightened to a sitting position. "I shall always be interested in the farm, Jerry, but I might as well tell you now seeing that you have already noted a changed attitude in me that I made a new decision shortly before I came home." By this time Jerry had slid from his seat on the cultivator to the ground alongside of his brother, evidently expecting that he soon would have him engaged in one of their old time confidential conversations pertaining to the future.

"You see, Jerry, it's like this. When I left home to go to college, I really thought that I would return at the end of the four years to join with you in running the farm. At that time I was only a boy and of course being brought up on a farm and not having had any other experiences to fall back on, I really believed what I had promised you at that time. I didn't realize that two years at college would change my thoughts as much as they have, but they are changed and that is what I want to talk to you about at this time. It's been on my mind ever since I've been home and I'm glad that you have noticed that I have not been exactly the same."

"Oh, come out of it, Jed," he said in his jocular way as he stared into the white, serious face of his brother. "There isn't going to be a funeral, is there? You'll see that what I have to say will be for your best interests also, so please look pleasant at least. You almost scare me, when you act that way. You always were too serious minded any way for a boy of your age," he laughed.

"Well, go on," urged Jerry, "I'm listening and I don't think that I shall faint either, but if you tell me that you are going to do something else instead of coming back to the farm, I'm right here to tell you that I'd hate to be in your shoes when dad gets hold of the news. He's got to where he's banking on you returning when you're through college and I've even heard him talking to ma about it. You can dig your own grave as far as I am concerned, but go on now and tell me what you plan on doing."

JERRY WAS A GOOD HAND WITH A TEAM ON A CULTIVATOR

"You'd make a peach of a fellow, Jed, for the very thing that I have planned on doing, and I'm not so sure but what you will form a partnership with me in that some time."

"Just pass over the hot air part of your tale," he replied in disgust and let's have what you've got to say before it is time to go up for dinner."

"Well, you've already guessed it, brother; I'm going to change my course this fall when I return to college. Not that I'm tired of studying agriculture, no not at all. I could study that all my life and still be interested to learn more about it. But I've just discovered within the past few months that I have some other talents which I believe will make me better fitted for the study of law. And so the truth of it is, I've decided to become a lawyer and the next year will be the first one to study it."

"Yes, and perhaps you'll be sick of that before the year is over," Jerry added in disgust. "If you don't watch you'll be like the rolling stone, you know the old saying says they never gather moss."

"Oh, I've got a good answer to that argument, sonny," Jimmy jumped in quickly. "A resting stone never gets a polish either," and he laughed outright at his brother as he left him standing in his tracks unconsciously kicking at everything movable—stones, lumps of dirt, anything—whilst he proceeded to climb back to his cultivator.

"Don't take it so hard, old fellow, you'll find out in the end that it will all be for the best. You'll go to college just the same and unless you get to be a rolling stone, you'll return to this farm and become the biggest farmer in the entire community, and I don't except Bob either. Besides, the Greene family needs a lawyer, being so many of us, some are bound to become involved so that only the proper interpretation and application of the law will straighten them out into the channels of good citizenship."

"What are you trying to do," said Jerry attempting a sickly smile, "trying to pull some of your flowery talk on me? Well, it won't work and I just hope that dad gives you the blessing of your life when he finds out about it. Say, kid," he bawled out in his anger, "do you know what's the matter with you?" But Jimmy only smiled,—the smile of the undaunted. "Well, I'm right here to tell you if you don't know it, that you're a fat head! Say, you've got the big head so bad that you think you can move the world, but you've got another guess coming. I don't care what you do! You wouldn't make much of a farmer anyway."

"Well, are you through?" answered Jimmy calmly. "You've given me quite a lecture, young man. I don't know but that you'd be a pretty good professor; guess you could handle the boys all right," and he stepped up and poked his brother in the ribs in an attempt to win him back to his usual composure and good nature.

"That stuff doesn't go with me and I'm going home," was Jerry's retort. "You'd better stay right where you are if you don't want dad to trim you," he called back while he used all the strength he had to hold the prancing Pete in check, so anxious was the old horse now that the noon hour had come. But if he guessed that Jimmy would follow his advice or if he had any doubts as to what was going to happen, they were quickly dispelled, for Jimmy not only caught up to him before he was half way across the field, but he whipped his team ahead before Jerry could realize what had happened. This only served to anger him the more and before either was aware what had really happened, the two teams found themselves racing across the dusty corn field at a breakneck pace.

"Get out of my way or I'll run over you," yelled Jerry as he swallowed a cloud of dust every time he opened his mouth. "Come on, Pete, you old pelt! Will you stand for this?" and he applied the end of the reins to the rump of the old bay so hard, that at times he almost lost his balance.

And old Pete responded the best he could—a response not at all coltish but still very good considering his fifteen years of hard service. Besides, he knew a few things about a race, at least a green race such as many a farm boy has enjoyed down in the back pasture on a Sunday afternoon. Yes, Pete in his day had been some horse according to the tales told by Jerry whenever the boys of the

Cow Waters Herself

with this wonderful new Libbey Automatic Water Bowl. Anima moves lever, opening water valve, when it starts to drink. Lever swings back, closing valve, when animal stops drinking.

15% More Milk

Milk is 87% water, and cows cannot give their greatest yield unless they have plenty of water constantly within reach. Farmers who use Libbey Bowls report an increase of 15% to 20%, which soon pays for the bowls.

(5)

Libbey Automatic Water Bowls

are the most sanitary and successful ever invented. Each bowl controls its own water supply, operated entirely by cow, and may be put at different heights, or in any stall or pen. No float tank required. Cannot overflow; cannot get out of order. Almost no water left in bowl to become stagnant. They save labor and feed and increase milk. Prevent spread of contagious diseases, as each cow has her own bowl and no water can pass from one to another, as with old-style bowls. Very simple and easy to install. Write for circular and prices, also FREE DAILY MILK AND FEED RECORD.

neighborhood got together. Pete had always been the winner in all of these events and according to Jerry, he could beat any of them still in spite of what he liked to call his infirmities.

And Pete knew now what was expected of him. With ears laid back and with neck and tail as straight as they could be comfortably carried, he laid to the task. His mate, a young black mare, was more than his equal and Jerry knew that if only Pete's wind held out, he would beat Jimmy to the gate that opened into the lane. Jimmy had one advantage. The pair of grey geldings that he was driving were both in their balmiest days, but whether this was really an advantage when compared with old Pete's knowledge of amateur racing was quite another matter. The fact of the matter was, Pete had the experience of years in knowing how to handle himself on soft soil.

Down the headland they raced, both yelling like young Comanches at their straining steeds. Jerry was gaining! Pete was using every ounce of his energy. He would go by his brother at all costs! He was now standing on the frame of the cultivator, lashing the backs of his frightened horses with all the strength that he could muster and still maintain his perilous position. And then something happened which gave him the advantage. In some unexplainable manner the teeth of Jimmy's cultivator dropped to the ground which served to check the speed of his team somewhat. But as Jerry afterward said, "the race was won by old Pete before that ever happened, for at that very moment he was a full length in the lead."

The first lap of the race was won and Jerry was off the seat in a hurry to open the gate leading into the lane so as to have the advantage in the home stretch down the long, grassy course. Nor did he lose any time in snatching the reins and getting back to his jockey seat. He was beginning to thoroughly enjoy the situation, notwithstanding the sympathy he had for old Pete who was panting so hard that made Jerry almost hesitate to continue.

And just at that moment there came a roar from somewhere nearby—a familiar roar that almost stopped his heart. "Hey, you stop running them horses! Stop it, I tell you, or I'll flog you within an inch of your lives!" Jerry faced Jimmy who was now up with him! He turned suddenly white and stood gazing with empty face while all the time the elder Greene was rapidly approaching at a dog trot pace.

"Well," said Jimmy with an air of bravado. "Get out of the way; I want to get through that gate."

"Well yourself," trembled Jerry. "You started it and you'll have to take the blame. He's mad as a mad dog and he's got a big stick," he almost whined at the thought of what might happen.

"Get out of the way I tell you," Jimmy commanded once more as he wedged his team in between the post and Jerry's cultivator.

"Stay right there, you young loafers," came from the irate father. "I'll teach you to loaf on the job and to run them horses that way!"

By this time he had almost reached them. Jerry started forth to meet him, but try as he might he made little progress, so stiff were his legs with fright.

"It wasn't my fault," he whimpered.

"Not a word from you," roared his father. "What does this mean?" he demanded looking sternly at Jimmy.

"Just a little race, dad," answered Jimmy lightly, "to see who has the best team and to settle a little argument that we got into."

"Yes," Jerry chimed in, "we had an argument and I got hot and started home and first thing I knew Jimmy tore by me to beat me home. And as soon as old Pete caught sight of what was going on, he just lit right out and I couldn't hold him back, so I just let him have his way. That's how it all happened," and he turned to hid his face in the heaving flank of old Pete, who was now puffing like a steam engine. "Anyway we won, didn't we, Pete," and he started to sob.

"I suppose that's some of the stuff you learned at college," said their father looking sternly at Jimmy. And Jimmy knowing the psychology of fathers and realizing that the worst was over said, "Sure, dad, that's a regular college trick! Hold your own! Don't let the other fellow get the best of you! But I'm really sorry, dad, that it happened, especially if you don't like it. But it was really fun and I guess no harm's been done. Pete and the colts will cool off and so will Jerry," he sarcastically added.

"Well, I want you to understand college ways don't go 'round here when it comes to abusing horses."

"They had a good rest before starting the race, dad," Jimmy interjected, "and they seemed to enjoy it about as well as we did, eh, Jerry?"

"Yes, indeed, you did rest! I was watching you both for the past three quarters of an hour and you never stirred from the shade of that old oak."

"Don't blame us, do you, dad?" Jimmy argued trying out his diplomatic graces on his father. "Why should we stir about on such a hot day. We enjoyed it and certainly the horses did, and besides you wouldn't have had the fun of seeing your oldest horse win the race if this hadn't all happened."

"What's the argument about?" he asked turning his attention to Jerry.

"Oh, it didn't amount to much I guess," responded Jerry who by this time had quite recovered himself now that the first scare was over. "I don't want to tell; it's Jim's business, let him tell you."

"Go ahead," persuaded Jimmy. "I got you out of this scrape, now let's see if you can do the same by me."

"Well, he told me," he began, "that he was not going to be a farmer when he gets through college. He says he's going to study law next year and I suppose the year following he will make up his mind to be a minister," he tried feebly to joke. "He's looking for a snap, that's what I'd say."

The elder Greene was completely silenced by this unexpected bit of news. It was plain that he was painfully surprised. His square, strong jaw dropped perceptibly and he moved slowly toward Jimmy.

Jerry who now feared a new outbreak attempted to come to the rescue. "He says there are so many of us in the family that the time will come when some of us will need the services of a lawyer," trying to clear the situation with this bit of light explanation.

"Well, I think it'll take a better lawyer than he'll ever be to allow him to study law instead of agriculture! We'll see about this," he replied as he threw himself onto the frame of Jerry's cultivator, saying as he did so, "Drive home now, this matter we'll settle there so that your mother will know about it."

Cass County Jerseys

HOARD'S DAIRYMAN:—The Jersey breeders of Cass County, Missouri, have just organized the Cass County Jersey Breeders' Association with the following officers: J. S. Moss, president; J. N. Denham, vice-president; and R. E. Miller, secretary-treasurer. The first work they will take up is a census of all grade and pure-bred Jersey breeders in the county in the hope of attracting all these men into the organization. The next project will be to eliminate the grade sires and form calf and bull clubs.

Missouri. F. W. ATKESON.

Jersey Cattle Notes

For week ending June 17:

Number of animals registered: Bulls, 204; cows, 564; total, 768. Number of transfers recorded: Bulls, 221; cows, 441; total, 662.

Watered Butter Prosecution Made Under New Act

With the watered butter bill in effect in Pennsylvania less than one month, eighteen prosecutions have already been entered by the agents of the Bureau of Foods, Pennsylvania Department of Agriculture. The offenders in every case were concerns located largely in the Philadelphia section.

The Act provides that butter shall not contain more than 16 per cent of water or less than 80 per cent butterfat, with a fine of $100 to $200 for violation, or imprisonment for 30 to 60 days, or both. Of the samples examined by chemists of the Bureau of Foods, one was found to contain more than 37 per cent of water.

Agents of the Pennsylvania Bureau of Foods have found similar butter frauds for several years past, but until the legislature passed the act covering the cases, the Bureau was without adequate machinery for curbing the practice.

Loyal Holstein Sale

The Loyal Holstein breeders held their first sale at Loyal, Wis., June 10, selling 56 animals for $8,380, a fair price considering that almost half the sale entries were bull calves.

Harry Gillingham, Wisconsin, paid $535 for one of the very best entries of the sale, a fresh five-year-old consigned by Jno. Wuethrich.

Mack, Krause, and Bowman did the selling with B. D. Scott in the box.

Following is a list of those animals selling for $200 or more and buyers:

S. P. Tenniss, Wisconsin	
Ormsby Battels Sadie	$230
Viggo Lorentzen, Wisconsin	
Clarice Cornucopia Ormsby	$240
Geo. Castner, Wisconsin	
Lady Alcartra Fayne De Kol	$225

Harry Gillingham, Wisconsin	
Jumie Dale Wa Wa	$535
Sub. for Cat. No. 39	500
O. L. Carteron, Wisconsin	
Sub. for Cat. No. 38	$500
R. K. Stevens, Wisconsin	
Queen Pontiac Melia Surprise	$325

Ohio Consignment Sale

The recent sale of registered Holsteins from accredited herds held at Austinburg, Ohio, June 6 did not bring out a high average but it was a fairly successful sale. But three of the animals offered had A. R. O. records and less than 20% were from tested dams.

The 68 entries sold for $11,670 with $410 the top price. T. E. Hutchins, Ohio, paid this for a 4-year-old daughter of Spring Farm King Pontiac from a 21.69-lb. 3-year-old dam.

The sale was managed by Secretary Barker of the state association.

The following lists those animals selling for $250 and over:

F. W. King, Ohio	
Maggie Hengerveld Pontiac Daw	$260
Lady Maplehurst Daw	295
C. W. Slater, Ohio	
Valencia Korndyke Pietertje	$275

WING'S ALFALFA SEED

has been standard for twenty years, and is better than ever today We can supply any amount of either Kansas or Nebraska seed, the famous Dakota Thirty or Grimm. Prices reasonable.

CLOVER and GRASSES

Northern grown and of strongest vitality. We can furnish grass mixture suitable for any soils. We also have some excellent varieties of seed wheat. Write for samples and quotations.
WING SEED CO., Box 221, Mechanicsburg, O.

Buy A Virginia Farm Now Now is the time to buy a farm in Virginia. Prices are reasonable. You can grow fine crops of corn—all grain and grass crops. Types of soil especially adapted to fruit growing. Opportunities for dairying unexcelled. Virginia offers more advantages to the farmer than any other State—variety of soil, mild winters, long growing season. Why farm where you can grow only two or three crops and be far away from good markets, when you can grow a variety of crops in Virginia and be near the great consuming markets? The healthiest climate in America, free from disastrous storms. Write now for Hand Book, maps, etc. G. W. Koiner, Commissioner of Agriculture, Richmond, Va.

Respectfully Submitted:

Every effort to create new markets for Holsteins is entitled to your prompt, practical and punchful-co-operation. On August 8, 1921, I shall offer forty head of THE breed at auction. All bred in the deep purple; all classy individuals; all pail-profit producers along with such high grade, healthy and "typy" individuals as you may consign to this sale. I want to make Victory Farms a market place of International importance to the Breed and must have your generous, practical help NOW. If you have nothing to sell, come and buy. Bring the folks. If you decide to participate as a seller ship tested, "clean," guaranteed stock via Reeding System to Victory Farms, Doylestown, Pa. References: Dun, Bradstreets, Middle City Bank, Philadelphia, Pa.; West End Trust Company, Philadelphia, Pa.; Solebury National Bank, New Hope, Pa. Monday, August 8, 1921, is the date. Victory Farms, Doylestown, Pa., is the place. Ship "clean" stock. Come along yourself.

MIDDLESEX MEADOWS FARM

OFFERS

Two outstanding AYRSHIRE BULL CALVES for sale for immediate shipment

No. 1—MIDDLESEX WHITE CHANCELLOR 25273, born September 17th, 1920.
Sire—Cavalier's Netherall Chancellor 21216, who sired the winning bull calf at this year's National Dairy Show.
Dam—White Heather of Highland 42752, who stood 2nd in the aged cow class at the same show (this year's National) and who has two good Roll of Honor records.

No. 2—MIDDLESEX MANCHESTER, born March 10th, 1921.
Sire—Auchenbrain Toreador (Imp.) 24761, record priced bull of the breed and Grand Champion at Maryland, New York, Connecticut, and New Jersey State Fairs this year.
Dam—Bida Clinton 31489, who has three A. R. records that average 11,000 lbs. of milk, 453 lbs. of fat, 4.17%; and whose two-year-old daughters will have records of over 10,000 lbs. of better than 4.00%.

Both bulls have excellent individuality, and are fit to go into any show ring and hold their own. They should dovelop into extra good herd sires. Prices reasonable—we **KNOW** you can't get as good as these two for any less money elsewhere.

A. Henry Higginson (Owner). **W. R. COUTTS, (Supt.)**

South Lincoln, Massachusetts

INCREASED PRODUCTION GUARANTEED

By mentioning "Hoard's Dairyman" we will know you are asking for a guaranteed bull.

If you are interested in
Economical Production of Highest Grade Milk
You should become acquainted with the ability for such production possessed by

Strathglass Farm Ayrshires

Among several noted bulls in service in the herd now numbering over 200 head are *Penshurst Mischief Maker, son of the World's Record cow for the breed and sired by a son of the cow standing second in the list for both milk and fat,* and others from the heaviest milking and best breeding families.
Sons of these bulls out of R. of M. cows now in offer may be counted on to materially assist in the accomplishment of above mentioned results.
We also have a few heifers of various ages to sell. Tabulated pedigrees and full particulars sent on request.

STRATHGLASS FARM, Hugh J. Chisholm, Owner, Port Chester, N. Y.

Meridale Jerseys

Head Your Herd With a Meridale Bull

The most practical way to increase the profit of a dairy herd is to head it with a pure-bred bull. Such herds average receipts of about $26.00 per cow per year higher than herds headed by a grade or scrub.

A good bull is worth more than his cost to the dairyman. We have a few such young bulls available. They are bred from Register of Merit ancestry, and give promise of being better than their sires. Figure what the *need* of a pure-bred bull is costing you. Write for booklet and pedigrees.

AYER & McKINNEY
Meridale Farms Meredith, New York

Monstone Farm Ayrshires

"Production — Size — Individuality"

Bull calves out of dams with A. R. records of 10,000 lbs. Mineral Home Farm, Platteville, Wis.

Judges for Eastern States

Announcement is made by John C. Simpson, general manager of the Eastern States Exposition held at Springfield, Massachusetts, that the prize awards in the cattle department for the 1921 Exposition, Sept. 18-24, will total $28,000. Mr. Simpson writes: "Without doubt the interest in the live stock show is growing each year, which we think is but reflecting the situation in this territory. Our dairy and farm implement manufacturers are all keenly alive to the growing popularity of this show. We are expecting increased attendance and do not think present conditions will affect this in any way."

The judges for this year's show are announced as follows: Ayrshire, W. P. Schanck, New York; Holstein, T. E. Elder, Massachusetts; Guernsey, Geo. M. White, New York; Jersey, A. C. Burnham, Massachusetts; and Milking Shorthorns, F. H. S. Perkins, England

His dam is just finishing a record of over 700 lbs. butter from over 17,500 lbs. milk at 2 years, 6 months. His dam's dam made 1,117 lbs. butter from 24,648 lbs. milk as a junior 4-year-old. At 7 years she made 34 lbs. butter from 742 lbs. milk in 7 days and 1,030 lbs. butter from 24,000 lbs. milk in 305 days.

Sire's dam made 27.86 lbs. butter from 658 lbs. milk in 7 days; 705.9 lbs. butter from 16,820 lbs. milk in 272 days, carrying calf 215 days.

He is a double grandson of SIR JOHANNA FAYNE, who now has 25 daughters averaging over 20,000 lbs. milk in a year, 15 of them in heifer form.

Northfield, Minnesota

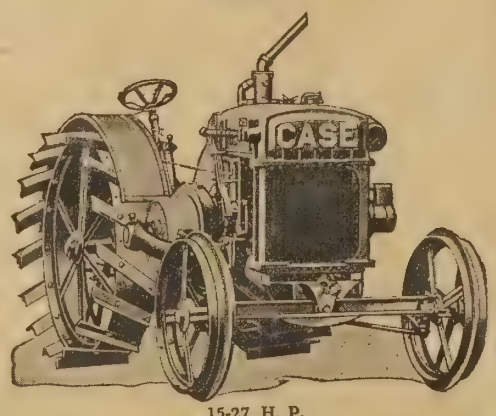
Save the Feed for Your Cows

THE man who depends on his cows for his profits, whether they are dairy or beef cattle, naturally has to consider carefully the matter of winter feed for his stock. Every ton of hay, ensilage, or grain fed to the work horses represents an *expense* that might have been a *profit*. By saving this feed for the cows, you receive a cash return on it in the form of marketable whole milk, butter fat, or beef.

Substitute Mechanical Power for Horse Power

A Case Kerosene Tractor—10-18, 15-27 or 22-40 H. P.—by displacing a certain number of horses will enable you to direct your feed into the channels where it will do you the most good. All heavy drawbar jobs such as plowing, disking, seeding, harvesting, etc., as well as all big belt power operations such as driving a thresher, corn husker and shredder, ensilage cutter or big-capacity corn sheller, can be handled to the best advantage, we believe, with a Case Tractor—and for these reasons:

Look For The EAGLE Our Trade Mark



Features of Case Tractors

The four-cylinder, vertical, valve-in-head Case motor, mounted cross-wise on a twist proof frame, operates successfully on cheap kerosene and delivers from 65 to 70% of its power at the drawbar. This is due to the liberal use of roller bearings and the fact that power is transmitted to the drive wheels through a train of simple, cut steel spur gears, enclosed in dust-proof housings and running in lubricant. The Case air-washer cleanses air of all grit, which is protection against rapid wear of cylinders, pistons and piston rings. The large diameter belt pulley is mounted directly on the crank shaft, which assures full power delivery to the driven machine, and is most conveniently located for belt work.

We'd like an opportunity to tell you all about Case Tractors—either through our catalog or our nearest dealer. Write us today.

"Keep the Flies away"

I guarantee it

COW-EASE is a clean, liquid preparation of the right consistency for applying with a sprayer. For 20 years I have guaranteed it to keep flies off cattle and horses and in all that time it has given absolute satisfaction to farmers the country over. It neither gums the hair nor blisters the skin. Beyond being humane and sanitary it is profitable as well, for a herd sprayed regularly with **COW-EASE** throughout the fly season will yield more and better milk.

Ask your dealer for **COW-EASE.** If he cannot supply you, send me your order per my liberal trial offer below.

Fort Atkinson, Wisconsin Volume LXI, No. 25 July 8, 1921

A Better Way of Milking

MANY dairymen are finding that the De Laval Milker is more essential than ever in times of lower prices. It enables milk to be produced cheaper by saving time; and increases the flow of milk, because it operates in a manner most pleasing to the cow. Therefore the De Laval Milker makes more profit for its owners by producing more milk at less cost. It will do the same for you.

Sold on such easy terms that you can use it while it is paying for itself. Send for full information.

COUNTING BACTERIA WITH A MICROSCOPE

BACTERIOLOGIST AIDS IN CLEAN MILK PRODUCTION BY INVENTING NEW TEST

RUSSELL E. FROST, WISCONSIN

THE banner of dairy leadership was raised to a greater height over the state of Wisconsin with the recent announcement of the invention of the Frost Little Plate method for counting the number of bacteria in milk. Of the nine important dairy tests in use today this makes the eighth contribution of the Badgers.

The "little plates" were developed in the agricultural bacteriology laboratories of the University of Wisconsin by Dr. W. D. Frost, and are the result of a big demand for a more rapid means of determining the quality of market milk. In the past it has been impossible to count the bacteria in milk in less than 48 hours. Today, by use of Dr. Frost's method, accurate counts can be made in eight hours, less than one-sixth the original time. This speedy test makes known the keeping qualities of milk before it reaches the consumer. By the old standard method this direct control was impossible.

Field Outfit a Feature

An important feature of the new test is its use in the field. Dr. Frost has devised a kit that can be carried about wherever occasion demands. The outfit is no larger than a traveling bag, and weighs about 20 lbs. when fully packed. This field outfit has made it possible to take the laboratory from the city to the farm. Enough material for counting the bacteria in 48 samples of milk can be transported in this "travelling laboratory". Should but one count be made of each sample, 96 analyses can be made.

The method has still greater significance in the light of recent developments in the buying of milk. In the East, particularly in New York State, milk is now being paid for on the germ-free basis. The lower the number of bacteria in the milk, the higher is the price paid to the farmer. The time is coming soon, predicts Dr. Frost, when this method of buying milk for human consumption will be as general as the buying on the butterfat basis now is. When this time comes, the value of the little plate method for determining the number of bacteria in milk will be very great.

New Test Uses Old Idea

The little plate test involves the use of the microscope. This was the first means, historically, of counting the bacteria in milk. In the times a decade or two previous to 1880, many difficulties were had with this way of determining the germ content of milk. So that with the introduction of the standard plate method by Robert Koch, a German scientist, in 1880, the microscope was quite generally abandoned for milk count work. In 1911, Robert S. Breed, working at the Geneva Experiment Station in New York, invented his direct count—which revived the use of the microscope in milk analysis. For certain types of counting, Breed's method is still in good repute. It is, however, somewhat difficult to operate and has the added disadvantage of counting the dead germs as well as the living, so that it becomes quite useless in ascertaining the quality of pasteurized milk.

In 1913, Dr. W. D. Frost of the University of Wisconsin conceived the idea of combining the standard plates, the accepted form in milk work, with the use of the microscope thus shortening to a marked degree the length of time necessary for the test, and at the same time counting only those germs which were alive and active. This is the idea that he has been working on and perfecting during the last eight years until we now have the test in the complete and accepted form known as the Frost Little Plates.

DR. W. D. FROST MAKING "LITTLE PLATES", A NEW TEST DEVISED BY HIM FOR COUNTING GERMS IN MILK

The apparatus shown here is packed in the carrying case which also serves as an incubator, and is used for field work.

Koch's Standard Plate Method

Quite frequent reference has been made to the standard plate method devised by Koch in 1880. Because it was the first method used and has been the accepted method for many years, a brief description is here given, which is also of much interest in comparing the length of the two processes.

By the standard plate method, after thoroughly shaking the sample to be tested, one cubic centimeter or about 15 drops are drawn off in a sterile pipette and mixed with sterile water until a quantity is reached which contains one part of milk to 1,000 parts of water. One cubic centimeter of this truly "watered" milk is then put into a glass dish that has been previously baked to kill all germs. Such a dish is fitted with a snug cover and the whole is called a Petri dish, "Petri" being the name of the German who invented this piece of bacteriological apparatus.

About 10 cubic centimeters of melted agar, a jelly-like germ food, is next poured into the Petri dish. The contents are then thoroughly mixed and allowed to harden. After the hardening process is complete, the dish is then put in an incubator and kept at the body temperature for 48 hours. At the end of this period white spots can be observed on the plates. These spots are colonies, and each colony is supposed to represent one original germ. By counting these spots and multiplying by the dilution the number of germs in one cubic centimeter, 15 drops can be easily determined.

New Method Shorter

Dr. Frost gives this description of his method: "A drop of milk, 1-20 cc, mixed with a similar sized drop of agar and spread over a definite area on a small oblong of glass spoken of as a microscopical glass slide. This is put in a moist incubator at the body temperature until the germs embedded in the jelly grow into colonies. The time required for this is between six and eight hours. By coloring the colonies with a blue stain they can be easily counted under the miscroscope."

Field Kit is Compact

Having described the manner of making the test, a description of the field apparatus, such as might be used on the farm, becomes somewhat more intelligible. Besides the carrying case there are several pieces packed compactly together and fitted snugly into the small case.

An asbestos-covered metal box which holds about two quarts of hot water is called a "warm table". This "table" is used to keep the slides warm while the milk and agar are being spread to form the little plates. It also serves to keep the tube of liquified agar from solidifying. Its third purpose is to furnish heat to keep the case warm while it acts as an incubator for the little plates.

The "moist chamber cabinet" is a metal box provided with shelves and a door. The little plates are kept in this while they are incubating to prevent them from drying up. Water in the bottom of the cabinet keeps a moist atmosphere.

A tin cup holds the agar tubes and the agar may be melted by boiling over a small alcohol lamp included in the case. A pipette box containing sterile pipettes and a small wooden box for holding glass slides, platinum loops, and other odds and ends of use to the tester completes the outfit.

Novel Germ Incubator

The carrying case is of wood and is lined with an insulating material and when tightly closed forms an incubator on the principle of a "fireless cooker". With this arrangement, the tester can make the plates on the farm, and they will be growing while he is returning to the laboratory. Eight hours after making the plates they are ready to be counted.

Little Plates Have Many Advantages

The Frost Little Plate test has many advantages over other methods now used. In the first place it is more rapid than other methods. Its speed is a big factor in favor of this test. The little plates are easy to make. It does not require months of special training to master the technique. In fact, the operator can become very proficient in a week's time.

The little plates form a permanent record of bacterial counts. Once made they can be kept indefinitely and will not change. Should a question arise at any future time regarding the cleanliness of a certain milk at a specified time, reference can always be made to the little plates. Similar to this feature is the sediment

Report of the Creameries Committee of Eleven

THE Committee of Eleven, appointed at the preliminary conference of the creameries of Minnesota held in St. Paul April 23, 1921, beg leave to submit the following report:

A State Organization of Minnesota Co-operative Creameries—What It Will Be, What It Will Do, and How It Will Do It

The state organization will be a corporation organized under the Co-operative Law of Minnesota for the purpose primarily of promoting, fostering, and securing improvement in—

1. Standardization and improvement in quality, through cream grading and proper methods of manufacture.

2. Shipping and transportation of butter and dairy products through carlot shipping.

3. Service in the sale of products of Minnesota creameries through closer co-operation with present distributing agencies and wholesale market receivers and—

4. Co-operative purchase of supplies such as salt, tubs, coal, etc., in carload lots.

5. Advertising.

How State Organization Would Obtain These Purposes

The state organization would obtain the purposes stated above by establishing the following departments:

1. Shipping and transportation department.
2. Standardization and quality improvement.
3. Contract and service in sales.
4. Purchasing of supplies.
5. Advertising.

How Each Department Would Benefit Co-operative Creameries

For the purpose of assisting the creameries in shipping and transportation and in standardization, they would be united into districts or groups of such number of creameries in each as are most practicable and necessary for assembling carlot shipments and for bringing the product to the highest standard quality. A district agent or manager would be employed by the state organization in each separate district, by and with the advice and consent of the creameries in each district. Thus, the state organization would maintain a working contact with each creamery through the district manager and each would be assisted in their shipping and transportation, also in the grading of cream and the standardization of the quality or their product.

The contract and sales department of the State Association would maintain offices, at first, in New York, Philadelphia, and Chicago and through these offices the quality of the product of each creamery would be inspected, on the market, the price received would be checked with the market quotations, freight bills audited and checked and the creameries assisted in every way in obtaining the best contracts and market outlets for their products.

Thus the offices in these markets would be able to give personal attention to the contract relations of creameries with the buyers of Minnesota co-operative creamery butter.

The purchasing supply department would be a minor department, and would keep creameries advised of the prices at which creamery supplies and equipment may be obtained. Probably one person would be able to handle all work of this department.

How the Organization Would Be Financed

The organization would be financed by the sale of stock to individual creameries based upon one $25.00 share for each 100,000 pounds or major fraction of butter made annually.

The sum would afford adequate capital for the purchase of office equipment and a working fund for the state organization. It would be supplemented by and the salaries of the officers and employees and other operating expenses would be paid by a charge per pound on butter made not exceeding one-half cent, such charge to be collected and the unexpended portion at the end of the year pro-rated back to the creameries in whole or part or used for such purpose as the delegates to the annual meeting may determine.

Definite Contracts Between the State Organization and the Individual Creameries

To provide for definite and clear understanding of the relations to be established and obligations to be assumed by the state organization with each individual creamery and of each creamery with the state organization, separate definite, specific, uniform, binding agreements shall be prepared and signed as evidence of the good intentions of each and every party. This agreement shall be a basic working part of the state organization.

Management of State Organization

The management of the state organization shall be entrusted to a board of fifteen directors who will employ a general manager who shall have direct charge of the affairs of the entire association.

The Board of Directors would be nominated by election districts and elected at large at the annual meeting and all policies and important lines of work of the association directly affecting the individual creameries should be referred by the general manager to the board of directors for approval before they are put into effect.

When Would the Organization Establish Actual Sales Offices

The organization would *not* establish actual sales offices until such time as the board of directors deem the same to be desirable and, as the establishment and operation of sales agencies would involve new policies and plans, also additional finances not here provided for or covered in the signed agreements with each creamery, it would be necessary to submit the plans for such sales agencies to the members of the state organization for their consideration and such action as is necessary to be taken to establish such agencies.

How Plan Would Be Put Into Operation

In order to put this plan into immediate operation, the Committee of Eleven recommends that this body proceed to consider and adopt a program of action, and that it elect a Board of Fifteen, composed of patrons or directors of co-operative creameries, which board proceed to perfect an organization to accomplish all the purposes here agreed upon, including articles of incorporation, by-laws, contracts, and all necessary business agreements, and submit the same for ratification to the co-operative creameries of the state.

[We are indebted to Roy C. Potts of the Bureau of Markets for the outline of the committee's report.—ED.]

WHAT'S THE MATTER WITH US?

A FARMER'S views on the economic situation and some suggestions for improvement were set forth by J. W. Coverdale, secretary of the American Farm Bureau Federation, before the National Implement & Vehicle Association of the United States of America in the Auditorium Hotel, Chicago June 15, 1921. Mr. Coverdale said:

"What's the matter with us? The right answer to this question would bring fame and fortune to any man wise enough to answer it today. The farmer himself would be glad to know the answer. Likewise a correct answer would probably be worth a great deal of money to the implement man. The manufacturer, the dealer, the lawyer, the journalist, the laborer, the banker—everyone is waiting breathless to find out what is ailing the farmer. Few questions are exciting more real interest just now. Last week a man qualified to know dropped in to our legislative office in Washington and declared unqualifiedly that the American Farm Bureau Federation was now mentioned more frequently in the public prints than any other organization in the world. This is significant. What is the matter with us, anyway?

"Emphatically, the only way to do business with a farmer, speaking in the large sense, is to show a sympathetic interest in his true welfare and prosperity. The farmer thinks he knows what is the matter with industry. The trouble is that your best customer has been too hard hit to feel very enthusiastic about doing business with you. In round numbers, half the wealth of this nation is in and on its farms. Approximately one-third of our national production is agricultural. The farmer is both capitalist and laborer. His profession has tended to make of him a supreme individualist. Up to a very recent date, he has not been organized. The Farm Bureau, which began as a chamber of commerce movement in New York ten years ago, seems to fit his needs quite well. On March 4, 1920, the American Farm Bureau Federation was organized. Today we have a total membership of 1,032,114. Every state in the Union, save one, is either affiliated with us or has signified its intention to affiliate.

"There are four things necessary to increase the buying power of the farmer's dollar at this time, namely: Marketing, finance, instructive information, and legislation.

"Production was the slogan during the war, and it is the slogan today, but it should be an intelligent production carried on in a business-like way and with a full knowledge of where it can be marketed so as to return a profit to the producer. We as producers in the past have been letting organized business tell us how to produce, with the result that today we find our granaries and our pastures full and no market outlet, and yet, in spite of all these obstructions, nearly the normal acreage of crops are in the ground, thereby proving to the world that the farmer is hopeful of receiving economic justice in the reconstruction period during which we are now passing.

"The producer is fast learning to cut down his cost of production by the use of efficient machinery that will increase the working capacity per man, and whenever this can be done he purchases the necessary equipment providing his financial system of obtaining credit either through his bank

(Continued on page 964)

The Illinois and Missouri Co-operative Milk Producers' Association is a marketing company that covers the territory tributary to the St. Louis market and that expects to start actual operation on November 1 of this year. It is an outgrowth of the Southern Illinois Milk Producers' Association but is essentially different in its organization. It was incorporated under the Illinois co-operative law on May 16, with an authorized capital of $500,000 divided into 5,000 shares of $100 each. Producers will be required to sign an agreement to deliver all their milk to the marketing company for a period of five years, the milk to be pooled and each to receive the same price for his milk whether manufactured or sold as whole milk except for deductions for freight and express.

The directors of the new organization are as shown above: Front row, commencing at the left: John Foster, Raymond, Ill.; D. A. Brooks, Marine, Ill.; John Dausman, Lebanon, Ill.; Fred Henke, Fruit, Ill.; H. J. Shultz, Shipman, Ill.; J. W. Koenigsmark, Ashley, Ill.; L. F. Ochs, Okawville, Ill.; N. E. Baum, Carlyle, Ill.

Back row, commencing at the left; O. K. Allen, Coffeen, Ill.; Percy Alexander, Reno, Ill.; A. S. Ennis, Festus, Mo.; Horace E. Drennen, Hornsby, Ill.; George Cassins, Edwardsville, Ill.; W. J. Goers, Altamont, Ill.; J. F. Hemminghaus, Nashville, Ill.; O. Argent, Winfield, Mo.; Herman Imming, Aviston, Ill.

MILK PRODUCTION AND UTILIZATION

MILK PRODUCTION IN THE YEAR 1920 IS NEARLY NINETY BILLION POUNDS

THE total production of milk in the United States for 1920 is estimated at 89,658,000,000 lbs. in the annual statement compiled by the Bureau of Markets and the Bureau of Animal Industry, United States Department of Agriculture. This amount is practically the same as for 1919, the production for that year having been placed at 90,057,500,000 lbs. The production of milk was decreased from 100 gals. per capita in 1919 to 98 gals. (848 lbs.) in 1920. There was a decrease in the number of milk cows in the country during the year. According to the Bureau of Crop Estimates, there were on farms 23,619,000 milk cows on Jan. 1, 1920, and 23,321,000 on Jan. 1, 1921, a decrease of 298,000. The number of cows other than on farms was estimated as 1,400,000 for 1919, but for the year 1920 the number was prorated from census figures as 1,200,000.

Per Capita Consumption

The consumption of fluid milk fluctuated during 1920. In the first part of the season there was an abundance of milk and the consumption was larger than that of previous years. However during the period of industrial depression that marked the closing days of 1920, milk consumption rapidly decreased, though this decrease was partly offset by the milk campaigns carried on throughout the country and which greatly increased the consumption in the territory covered. The estimate of the population of the United States as used in the annual statement covering 1919 was too high, as shown by the returns of the late census. But when the quantity of milk used for household purposes in 1919 is divided by the correct population figure the consumption of milk for 1920 is shown to be the same as for 1919, i. e., 43 gals. per person.

The amount of milk used in the manufacture of oleomargarine was estimated this year from data received from the factories and shows a decrease in the proportional amount of whole milk used. The quantity of milk and skimmed milk combined, as now used, is practically equal to the quantity of whole milk formerly used. However, in the manufacture of nut margarine, whole milk is not used in the same proportion as in the regular oleomargarine.

This year original data were received from the factories relative to the quantities of milk used in the manufacture of milk chocolate and, while complete reports were not received, the quantity shown in the table was prorated from these reports and is very conservative.

The production figures for ice cream are estimates. The figures for 1920 show an increase in production of 13% over 1919 based on factory reports received by the U. S. Bureau of Markets. Calculations were made on the basis of 13.75 lbs. of milk per gallon of ice cream for 1920 and 15 lbs. for 1919. The latter figure was based on the "batch" method of manufacture only. Ice cream made by the continuous machines weighs less per gallon. The quantity made by the continuous method was large enough to warrant the use of 13.75 lbs. per gallon for the year 1920.

The total calf crop for 1919 was estimated at 80% of the number of cows. Data compiled more recently from a number of representative states indicate that the estimate was too low and that the calf crop was 90% of the total number of milk cows. The number of calves slaughtered at birth and the number vealed are estimated from data obtained from the principal market census reports, and reports of the U. S. Bureau of Markets.

In a comparison of the figures for 1920 and 1919 a decrease is noted in the quantities of milk used in the manufacture of butter, cheese, condensed milk, powdered cream, and oleomargarine. An increase is shown in the quantity used for whole milk powder, malted milk, sterilized milk, ice cream, and household purposes.

Production and Uses of Milk in the United States, 1920 and 1919

Product	Milk used per unit of product	1920 Quantity of product manufactured	1920 Total whole milk used	1920 % of total milk	1919 Quantity of product manufactured	1919 Total whole milk used	1919 % of total milk

Cotton and Cows in Salt River Valley

M. E. BEMIS, ARIZONA

ONCE more the pendulum of Father Time's renowned clock has swung far out of the ordinary path. Last year the cotton farmers of the Salt River Valley, in spite of vigorous protests on the part of bankers, the Chamber of Commerce, and, it might be said, their own better sober judgment—sold off their dairy cows, plowed up alfalfa fields and planted cotton—cotton and still more cotton, until in almost two of every three acres was growing the fleecy staple that looked from the enchanted distance that the planter viewed the harvest, like the good long green. This was once when the pendulum swung far out of line and now it bids fair to go almost as far the other way, that is to say, the cotton fields are being forsaken for other crops, with a future market price as illusive as cotton or maybe more so. An insistent demand for dairy cows is going up from many of those who discarded them and instead of two of every three acres in cotton, only one of every four bids fair to sport the "white gold" (or was it the "White Elephant"?) this season of 1921.

The mischievous boy that surreptitiously opens the old clock and gives the pendulum an extra impulse, has the satisfaction finally of seeing it swing almost as far the other way and then after a few spasmodic swings settle down to the same old steady to and fro motion.

BALES OF COTTON AWAITING SHIPMENT IN THE SALT RIVER VALLEY

Cows were sacrificed to make way for more cotton and now the farmers have the cotton and the regrets for chasing a one-crop delusion. Diversification with the dairy cow is the slogan for success. It should be "cows and cotton", not "cows vs. cotton".

REGISTERED HOLSTEIN-FRIESIANS OWNED BY J. R. BRADSHAW, SALT RIVER VALLEY

It is altogether likely that after this little jolt we may expect things to settle down to a steady course. The cotton farmer has seen the folly of planting his entire acreage to a single crop and not willingly will he return to a one crop system. Cotton as a money crop has decided advantages and even now with markets uncertain, no one can truthfully say that cotton raised under proper conditions is not as profitable as any other crop, particularly as it does not appear that the Long Staple cotton will not remain relatively as high as the Short Staple or other crops.

Cotton, to be profitable, must be grown on land that is best adapted. This is not altogether the desired soil type, although certain types of soil are better adapted, but it is more especially the condition of the soil as determined by the crops which have been previously grown upon it. It so happens that some of the best crops of cotton have been grown upon farms where the soil had been built up by growing alfalfa and feeding it to dairy cattle, either pasturing or feeding hay, and returning the manure back to the land.

Dairying as a business with cotton grown on one-fifth to one-fourth of the land as a money crop is an ideal plan and one that bids fair to be worked successfully.

There is a strong sentiment now among farmers to get back into the dairy business. That some measure should be taken to insure building upon a firm foundation, is necessary and the necessity of this step is fully understood by those most interested.

H. C. Heard, county agricultural agent, in a recent statement said:

"The exodus of the dairy industry of the Salt River Valley and the subsequent urgent need of the replacement call to mind the dangers of reestablishing on other than a conservative, carefully planned basis. It is vital that mistakes of the past must not be repeated and that our new dairy industry must be rebuilt as rapidly as possible around high produc-

(Continued on page 976)

An Iowa Milk Week

H. J. METCALF, IOWA STATE COLLEGE

OSKALOOSA, Iowa, has recently held a milk campaign, the results of which are now being made public by Miss Florence Imlay, Iowa State College, who with the local authorities at Oskaloosa and the assistance of Miss Louise Holbrook of the U. S. Dairy Division, carried the campaign out to a most successful conclusion.

The campaign was a four-day affair and the object was to bring to the attention of the parents and school children of the city the wonderful results which might be obtained by the persistent use of milk as a daily food.

Three meetings were held each day, one in the forenoon, one in the afternoon, and one in the evening. Large crowds attended all of these meetings and it is estimated that fully 10,000 or more persons were reached through these gatherings.

The work of combating malnutrition in the children of Iowa was started by Iowa State College several years ago, when Miss Imlay inaugurated a three months' campaign in the state, tending to show the value of milk as a food for the growing child. The campaign attracted much attention and was the means of inciting an interest in the use of milk and milk products which has steadily grown until today practically every county in the state has one or more agencies working on this project.

In the Oskaloosa campaign, just closed, a number of agencies contributed to the success of the venture. The Red Cross health department, city officials, nurses, farm bureau, county agent, and the state college milk specialists were all pressed into service with the result that hundreds of school children and parents were "sold" on the idea of using more milk in the daily diet as a means of combating malnutrition.

As an evidence of the foregoing statement milk dealers in Oskaloosa say that the consumption of milk, as shown by their sales since the campaign, has increased from 9% to 25%.

Some of the publicity methods used in attracting attention to the work in the city and surrounding territory were as follows:

Poster contest open to school children, with prizes.

Health sermons by ministers of local churches.

Talks by milk utilization specialists daily.

Displays in local store windows by high school girls and home economics students of Penn College.

Co-operation of local dairies.

One of the most attractive illustrations of the use of milk as a food, and which drew attention most forcibly to the campaign, was the display in one of the local store windows where four healthy and vigorous youngsters were served a "balanced ration" by the home economics students of Penn College. A menu in three courses was served the children, consisting of cream of tomato soup with crackers, a bread and milk course with custard side dish, a baked apple with cream, and baked custard for dessert.

AN ATTRACTIVE MILK WINDOW

Children were the attraction of the display in a local store at Oskaloosa during "Milk Week".

Not only were the children shown partaking of this well balanced meal, but a model kitchen was shown in the window, much to the interest of those who came to see and learn.

The employes of a starch factory and garment factory were talked to by the milk specialists and it was found that there was an intense interest in the greater use of milk as a food.

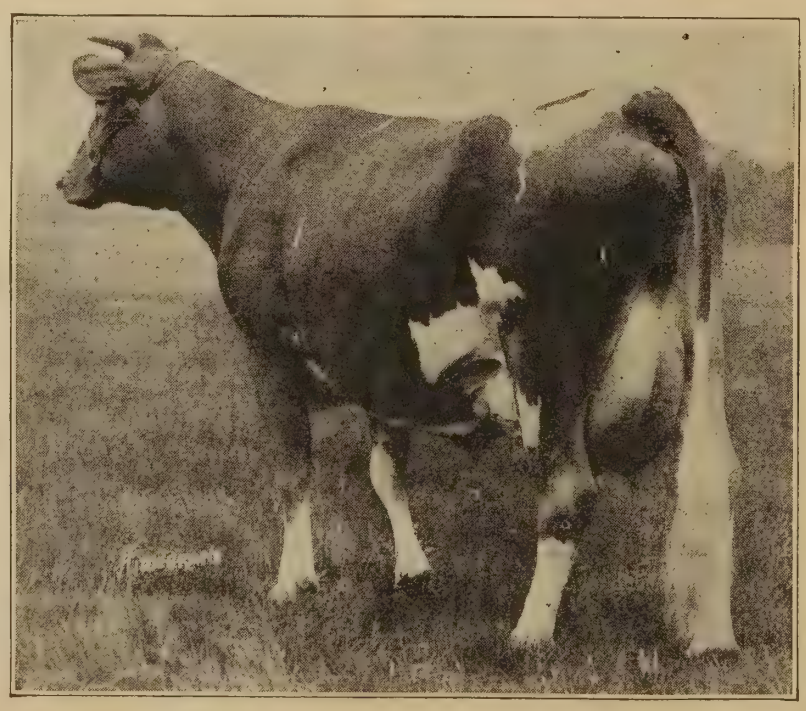
The Producers' Co-operative Dairy, one of the first institutions of its kind in Iowa, and a model in point of neatness and modern equipment, threw open its doors to the public at the conclusion of the four-day session and served ice cream and buttermilk to the public free of charge. Hundreds of persons availed themselves of this invitation to see a modern plant, the first of its kind in Iowa to co-operate in the handling and marketing of dairy products.

This plant is now handling 130,000 pounds of milk each month and has a butter making capacity of 24,000 pounds in the same period. Five thousand gallons of ice cream can be made every thirty days. The high standard of dairy products being sent out by the dairy is a source of great satisfaction to the men back of the venture. The equipment is modern; a cream separator of 3,000 tons capacity has just been added.

Miss Imlay, who had charge of the campaign at Oskaloosa, says that there is a great demand in many localities in Iowa for similar campaigns and it is the intention of the Agricultural Extension Department of the College, co-operating with local authorities in various communities in the state, to put on this work wherever there is a local demand for it.

Dairymen's League News

H. H. LYON, NEW YORK



IT is the custom in many counties in Dairymen's League territory to hold county League meetings at quite regular intervals. Chenango County claims to take the lead in League affairs and sometimes does. It is the first county to hold a meeting at the League headquarters in Utica, this season, being held just after the middle of June.

In opening our session, the president, Mr. Kershaw, spoke of the difficulties that have been met since last October first, and of the little technicalities that arise daily. Some of these matters are mistakes in names or names written in full in one place and with initials in another. Dealers raise objections in such cases and similar ones. One thing emphasized was that there will be no "dead horses" to pay for. The three cents deducted includes, I am told, for a small reserve, and no debts of any kind are incurred. While considerably under forty thousand farmers are in the pool for May, the association is handling over five million dollars.

If it were not for pooling we would not now have any organization for selling milk. We would make no prices to anyone and our milk would sell at about a dollar a hundred. The League, said Mr. Hovey, has made its members two million dollars in the month of May.

Mr. Hovey, who is general manager of the co-operative organization, finds that 435 million pounds of milk are reported, which he thinks is 75 to 80 per cent of the milk handled. About 58 per cent of this is now pooled. Of the milk pooled, 37 per cent goes as fluid in class one; 19 per cent is in class two; 13 per cent in class three; 16 per cent is in butter; and 15 per cent in cheese.

Mr. Eastman of the League News argued that we must have the public with us. Once the railroads had a "public be damned" spirit and it resulted disastrously to them. Labor seemed to take that attitude and is losing sympathy. The League must not take any such attitude. The city finds fault with the country and the country finds fault with the city. We better discontinue this and simply get the truth told about farming. Milk at a high class hotel costs 60 cents a quart while the farmer gets six cents. Our organization needs to help correct such conditions and correct the impression that the farmer gets any considerable share of the sixty cents.

PREMIER RECORD GUERNSEY OF MINNESOTA

In March Ma Chere Procris, Guernsey cow owned by Shorewood Farm, Minnesota, completed her third A. R. record making 17,921 lbs. milk and 832.0 lbs. fat which entitles her to leading place in the breed in Minnesota. She was bred by Mr. S. M. Shoemaker of Maryland and purchased as a two-year-old by Shorewood Farm. She has two other records to her credit, of 489 lbs. fat in Class G and 684 lbs. fat in Class E. In 1919 she was first prize and senior champion at the Minnesota State Fair and first prize 4-year-old at the National Dairy Show the same year.

Bradley Fuller said the pool contract was not made strong on account of the 95 per cent of loyal pool members, but for the fellow, for example, who, after signing, turns his dairy over to someone else and so avoids pooling. He will be invited to Oneida County to explain why he did it. This contract of four pages was the result of four months of hard work by many minds, legal and other. It is found as it goes into effect that every paragraph is needed.

Ten years ago, said Mr. Milliman, not a farmer in this room would have signed a pooling contract. Today 73 per cent of our active members have signed it and the contracts are coming in at the rate of a hundred a day. Fifty-five thousand, four hundred twenty-nine have signed and there are less than 20,000 more to get to make it 100 per cent. What to do finally with the unsigned man is a problem, but Mr. Milliman is sure that we have not yet come to the point where we should impose any fines.

After a two-session meeting in the hall, the company adjourned to the League building to inspect the offices. The presence of this one hundred League members in Utica, their contact with the heads of departments, and the actual inspection of the machinery and the methods at headquarters will carry a closer knowledge of League conditions at the office to our members in the county than any other method could. It looks like a good plan for other counties to follow.

Eggs that are gathered often, kept clean and cool, and are candled and graded bring better prices at the market than the "just eggs" kind.

New York Dairy Notes

H. H. LYONS, NEW YORK

INSPECTION is again troubling us a little. We have been getting along fairly well for several years. Possibly some of the inspection of our stables has been a little loose for five years. The quality of the milk in our shipping territory has been good and it is to be doubted if too much attention should be given to the stables where a good quality of milk is had. Now there is a surplus of milk and in the surplus season inspectors are reaping their harvest. This may be a mere coincidence but one is liable to doubt it. It is not intelligent inspection that we object to but incompetent inspection. The inspector from the city is still a poorly informed man. He knows the rule but he doesn't know milk nor plants nor stables. He emphasizes the wrong points often. He is not a farmer, therefore does not know the essentials of good stables for milk. He is not a creamery or station man and does not know the details that need attention there. He misses the point all around by being obliged to follow rules blindly.

⚜

Managers of plants are averaging much less arbitrary than formerly. Many of them are very agreeable gentlemen. Ten years or so ago, perhaps twenty years also, they were in cases somewhat like the heads of the company employing them. We all remember if in the dairy business then that some of these concerns doing business were decidedly arbitrary and much inclined to squeeze the dairymen. Our organization broke up a large part of that. The Dairymen's League has much to its credit (that means the farmers composing it) besides helping to make a price for milk.

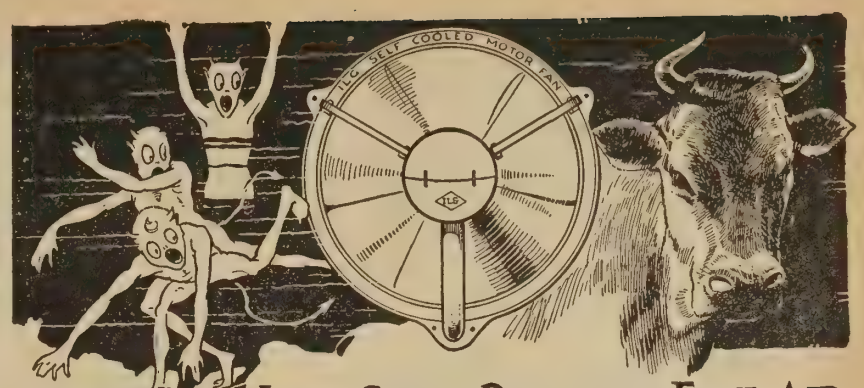
⚜

Short weights, low tests and returned milk at the platform are apt to be the complaints. I am satisfied that the men on the platform may occasionally be too exacting. At the same time I am certain that a farmer may not be as exacting with himself as he should be. Both parties are human and liable to be biased, and may even be too quick spoken in relation to matters of disagreement. With fifty or sixty thousand pounds of milk to handle in a few hours some one must act quickly. One man removes the covers and inspects the milk. Two others dump it, sample it for the Babcock test, invert covers and cans in the washer and see that the washer operates properly. One other weighs and records, while still another takes the cans from the further end of the washer and returns them to the wagons. From time to time this varies and every man there may at times dump some milk, take samples, etc. I have watched this process by the hour. I have noticed what I thought was more care not to slop and waste milk while some one was on the watch. That would be very human. Even with care I think that while hurrying there is pretty close to a wastage of one per cent.

In the case of two hundred patrons with few if any of the cans numbered it would seem very easy to put a sample in the wrong sample bottle, or for the weigher to read the weights wrongly or place them against the wrong numbers. I have never known the wrong sample bottle to be used but think it possible. I have known the wrong weight to be credited a man but I think these seldom happen. Mistakes are possible but their occurrence seem to be surprisingly infrequent. Again I have seen the outlet cock left open for an instant as a new batch of milk goes in. These four men seldom let such a thing occur, for some one of them is almost certain to see it. Here again I am inclined to the opinion that there will be fewer mistakes if some one happens around occasionally. This is human nature again. It is pretty exacting work and a man has to think quickly and keep at it. Occasional mistakes it seems to me are almost sure to occur. I think it the part of wisdom to occasionally employ a man to "happen around" and watch proceedings a little.

⚜

The farmer should school himself to make his own accurate weights and should keep a record of them. It would be wise if he occasionally made his own tests or had them made. Then he should check these up frequently. It takes a little time but it is likely to pay. I made three samples at the plant for one dissatisfied patron just recently and got a test three points higher than he had been given the month previous. When I went to the office to check up I found that mine was within a half point of the new test given there. I do not think that the former test was wrong but that the real fat content of the milk had changed in a month. Some farmers, however, would hardly accept that view. It is a good plan to keep some of these matters checked up before the complaint is made. The local organization can do this best unless the farmer himself does it.



⚜

In pre-League days it was quite the custom for the milk dealer to squeeze the farmer. It is now said that the farmers' organization has the power to squeeze. I am not quite certain about it. If it has that power there are those who think it right to do it. This is something that our League folks are trying to avoid. What is needed is to get a fair price for producers, but not to demand anything unreasonable. This is realized and is the aim. Most farmers and their representatives realize this and that will make it easier to accomplish.

We still have reason to watch the Nestle's. They fight the League and refuse to buy through it. They offer prices that are in advance of the pool price if not paid through the pool. That means more money to the farmer if he stays out. No doubt some farmers are influenced by it, yet the Nestle's concern is apparently playing a losing game. There are reports commencing to circulate that the concern may soon come under new management so far as this country is concerned. If so, some new policies may be expected.

Pure-breds in Minnesota

The census of 1920 credits the state of Minnesota with a total of 32,668 pure-bred dairy cattle, of which number 21,436 are females. The various breeds are credited with the following number: 399 Ayrshire, 483 Brown Swiss, 4,468 Guernsey, 22,830 Holstein, 2,508 Jersey, and 1,980 other breeds.

DON'T LET YOUR COWS BREATHE FOUL AIR

YOU can't grow good beef on poisoned cows! You can't get good and abundant milk from the cattle that have to breathe the sickening fumes of manure and excretions!

Yet, that's what you expect when you permit your cows to inhale the rotten, poisonous odors that arise from dung in the improperly ventilated cowbarn—the foul tainted air that seriously effects the food value of hay and grain and robs you of a maximum milk yield.

Safeguard your cattle with an I L G

FARM BARN POWER VENTILATOR

Dairy experts agree that fresh air is *two-thirds of a cow's ration.* Ventilate your cowbarn by installing an I L G FARM BARN POWER VENTILATOR. It draws out the stench—exhausts the gasses and poisons from the air.

Easily installed—costs very little to operate. Made for 32-Volt D. C. and 110-Volt Standard Currents. Keeps the hay and grain pure and sweet, and provides the cattle with clean, fresh air — to grow more healthy and yield more good milk.

Write direct for literature. Or ask your hardware or electrical dealer to demonstrate the I L G Farm Barn Power Ventilator.

HOW much better it is to provide cows with a *warm* floor than to try to make a cold floor warm. Circle A Cork Brick require no bedding for warmth. They are make of cork (70% by volume) and cork is a non-conductor of heat. When you touch a cork brick, it feels warm because it holds the heat of your hand just as a blanket keeps you warm by holding in the heat. A floor of Circle A Cork Brick is like a blanket *under* your cows, where they need it most. It is their best protection against chill and dampness and against garget, rheumatism and pneumonia. It will save you many a day of lost production and many a dollar in veterinary bills.

Send for a sample brick and you will understand why more than twelve thousand barns have stalls floored with Circle A Cork Brick. The 28-page book, "Better Stall Floors," and the sample are sent free on request

EDITORIAL COMMENT

FILLED MILK LEGISLATION

At a conference of the representatives of the Wisconsin dairy and farm organizations held on June 20th, at the Wisconsin College of Agriculture, resolutions were adopted requesting national filled milk legislation; approving a draft for a bill providing for licensing and taxing manufacturers and dealers in filled milk; and asking that the Ways and Means Committee of Congress, or its chairman, report the bill.

In our visit to Washington, in behalf of filled milk legislation, we were informed that several congressmen desired to introduce bills and that two bills were already before congress. This circumstance and that the bills before Congress need amending led the representatives of the dairy and farm organizations to request the Ways and Means Committee, or its chairman, Mr. Fordney, to introduce a bill.

We believe this is the proper course to pursue, and we urge all dairy organizations to support this plan.

BUTTER RULING

It has been reported to us upon good authority that the Internal Revenue Commissioner, Mr. Blair, takes an entirely different view of the neutralizer butter ruling than his predecessor, Mr. Williams. It is expected that he will modify or rescind the ruling pertaining to neutralization of sour and decomposed or rancid cream.

We have not been able to approve of Commissioner Williams' ruling that the neutralization of sour and decomposed or rancid cream produced adulterated butter. We do not believe rancid or decomposed cream should be manufactured into butter. It is unfit for human food. The ruling is a misapplication of the adulterated butter law.

We are wholly in sympathy with those in Minnesota who desire to stop the use of unfit cream for the making of butter, but we believe this evil must be reached in another way than by the neutralizer route.

LOCAL CREAMERIES TO ORGANIZE

The proposed creamery organization of Minnesota meets our approval. It is a step that the creameries of all states must take if they are to protect themselves from unfair competition, manufacture a uniform grade of butter and market it in the most efficient way, and otherwise place themselves in position to render their patrons the proper service. The local creamery has been under a handicap because it has not been in position to cope with the centralizer in the selling of its product. The proposed plan of organization provides for districting the creameries so that their business may be carried on as a unit.

The butter of these creameries will be standardized and marketed co-operatively. This will insure them a larger return for their product and a material saving in marketing expense, both in transportation and commissions. The purchasers of butter desire to buy a uniform grade of butter and from sources which can supply them whatever quantities they need. For such butter and in unlimited quantities they will pay a higher price than for butter of better quality coming from many sources. This has been shown in the prices which centralizers have received for their butter which scored less, but being uniform in quality and in carlots made it a more desirable product for the butter merchant to handle.

The only way the local creamery can protect itself and obtain for its butter the highest market price is through co-operation with other local creameries. Elsewhere in this issue we give the report of the committee of eleven, selected for the purpose of proposing a plan. This plan may need some modification to make its operation fair and just to every member, but with the right spirit and object back of it this will not be difficult to do. The main object is to get the local creameries working together for the purpose of standardizing their product and to carry on their affairs in a more profitable manner.

PRODUCTION AND MARKETING

The average yearly production of the cows of Wisconsin is estimated at 4,925 lbs. milk containing about 190 lbs. fat. Close students of their business have herds that average 300 lbs. of fat per year and some as high as 400 lbs. In 1920, the average cow returned $123.50 for fat, and the cow which produced 300 lbs. fat returned $195 or $71.50 more than the 190-lb. cow. A secretary of a successful milk producers' association estimates that in 1920 farmers received, on the average, ten cents more per hundred for their milk, due to their organization. In other words, $4.92 per cow, based upon the average production of Wisconsin cows. This is a good showing and well worth the effort of organizing so that their milk could be sold co-operatively. But as important as it is to improve generally our methods of marketing farm crops we must not lose sight of the larger opportunity to increase the returns of the farm.

Through an improved method of marketing, an association obtained for its members $4.92 per cow per year. That was good. Through an improved cow, one that produced 300 lbs. of fat in a year, a return of $71.50 more was obtained than from the average cow. Better selling brought $4.92, but a better cow brought $71.50 or 14 times as much.

The farmer's opportunity for increasing his profits lies to a much larger degree in production than in marketing. Production will always be the big job of the farmer, but the sensible farmer will give due consideration to both marketing and production.

THE FARM BUREAU

The farm bureau is misunderstood by some farmers. They seem to think it is some form of organization separate and apart from themselves. One farmer has said: "When the farm bureau is fully organized and running properly we farmers will not have to do any thinking for ourselves or be concerned about our work; that will all be done for us by the farm bureau." It is evident this man does not comprehend the purpose and object of the farm bureau or he would not rap it in this way.

The farm bureau is an organization of farmers and no one else has any power in directing its efforts. It is not organized for the purpose of doing the thinking for any farmer or any one of its members. It has never had any such ridiculous ideas; if it ever does get any such conception of its duty it will not take long before it will realize its mistake. The men in active charge of the farms, if they are to be successful, must do their own thinking. This can never be delegated to anyone else and we should be thankful that it cannot.

We like individuality. We favor plans which will give the individual every opportunity to develop his talents. Any form of organization which submerges or tends to submerge the individual is positively harmful. The farmer has always prided himself on the fact that his occupation gives him every chance to exercise his individuality, to do his own thinking, and to follow his own ideas in doing his work. He has tried to do too much by himself and as a result has found himself unable to cope with organized effort. He too frequently gets the short end of a deal.

It is commendable that the farmer desires to do his own thinking; to plow his crops, to manage his live stock and everything that pertains to his farm operations. The wise farmer, of course, is alert to learning of new things that will help him to be a better farmer. He must keep his mind open. All this he must do. He must also be ready to co-operate with his neighbor in doing things impossible for the individual to do alone. There is little hope for the farmer who does not appreciate the large opportunity of working with his neighbor. The community must have its social functions, its co-operative enterprises, its laws, etc. None of these can be accomplished by one person. It requires many. The farmer can build a road from his home to the public highway, but to build a public highway to town is too large a task for the individual farmer.

The farm bureau is not organized to do the thinking for any farmer or his work, but rather to assist all the farmers in the discharge of their public duties, to help lay sensible plans for carrying on work that can only be done co-operatively, and to place agriculture upon the same basis as other enterprises are conducted. These things, and many others, cannot be accomplished by the farmer working individually. There must be a directing agency and those that have seen the necessity for such a force have organized the farmers that they may direct their co-operative and public affairs effectively. They have called this organization the farm bureau.

MORE EFFICIENT DISTRIBUTION

This period of wide variation in prices of commodities has shown clearly that our methods of distribution are too costly. Leaders in agricultural thought have for years recognized this and have urged plans for making the distribution of all commodities less expensive. It has been pointed out that by a faulty marketing system a car of corn was shipped and reshipped, and after traveling several hundreds of miles and handled by several commission firms, it was sold to a farmer living not many miles from where it was grown. This perhaps is an exceptional case but many similar instances could be cited to show the necessity of a better system of marketing.

Recently a car of butter was sent to a commission firm in a large market and this firm turned it over to another commission merchant and made a profit of $100. No service was rendered for the profit made on this car of butter, but the commission charged on the car increased the cost of butter to the consumer and the producer received a smaller percentage of the consumer's dollar.

There must be agencies in every city for handling farm products, but it is unnecessary to have several commission firms make a profit on the same car of butter. Through better organization of the creamery interests this could and should be avoided.

It is encouraging to note that dairy and farm organizations are attempting to improve our system of marketing farm crops. May their work eliminate the useless middleman and provide for all farm products a more direct route from the producer to the consumer.

POWER OF ORGANIZATION

The efforts put forth by the Illinois agricultural interests to pass the Lantz bill, a measure to eliminate some of the evil practices of boards of trade, seem to have borne some fruit. In a report of the Illinois Agricultural Association we find the following statement:

"In recent issues of the Chicago newspapers, the Chicago Board of Trade announces that it is to have a 'house cleaning'. In the announcement is practically an admission by the Board itself that the evil practices charged by farmers exist and that they should be corrected. Four committees have been appointed to prepare 'drastic amendments to the rules' on private wires, manipulation, false market news, and indemnities. It is promised that there will be rules to provide against manipulation of the market upward and downward. In this connection it might be just a bit appropriate to mention that Board of Trade speakers solemnly affirmed before the legislature only a few weeks

ago that such a thing as manipulation was impossible! The Board also promised rules against overtrading, spectacular trading, matching orders, and a number of other practices which it tacitly admits were not in the best of business ethics.

"Indemnities are to be abolished, it is affirmed. The Board promises strict censorship of market news and declares that the circulation of false or misleading reports is to be vigorously punished. Private wires may or may not suffer a change as the committee to regulate them is divided in policy. In short, the Chicago Board of Trade practically admits most of the evils charged to it by I. A. A. members."

The house cleaning proposed by the members of the Chicago Board of Trade shows the power of united effort and why farmers should have strong organizations.

Oats for Silage

Will oats cut in the milk stage make good ensilage for July and August feeding? We use corn ensilage for winter feeding and are thinking of trying oats for a summer ensilage. Will oats make good ensilage?

Blue Ridge Summit, Pa. S. F.

Oats cut in the milk stage will make a good silage but care must be exercised to see that the straw has not become so dry that it will not pack well. It would be preferable to combine some clover with the oats in order to assist in the proper packing of the ensiled material. Grain, however, is used to a considerable extent for ensilage purposes in the western country and has proven very satisfactory. The greatest danger is that it will have reached too great maturity before cutting is started.

Rutabagas Grow on New Land

I will have cleared about an acre and a half of new land by the last of June and would like to know whether or not it will be too late to plant the seed. They tell me rutabagas make excellent succulent feed for cows. What is the best way to prepare the seed bed? This was hard wood land and the soil is clay loam. Shall I drill or broadcast the seed and how much to the acre?

Laona, Wis. G. H. M.

Although somewhat late for planting rutabagas, we know of many cases where exceedingly good crops have been harvested from late planting. This is particularly true should occasional and timely rains come during June and July. As a late crop for newly broke land, rutabagas can not be beat. For Northern Wisconsin, where corn is not always an assured crop, rutabagas can be grown most profitably and successfully for succulent feeding to dairy cows.

From 300 to 400 bushels to the acre can easily be grown. Under favorable conditions from 600 to 800 bushels have been grown in various sections of the state. Rutabagas make most excellent succulent feed for dairy cows, particularly in the early fall before opening the silo. Rutabagas should be sliced into pieces from one and one-half to two inches in size before fed; otherwise there may be danger of the animal choking. They are best fed after milking with a sprinkling of wheat bran or ground feed. From 20 to 30 pounds fed daily to a cow gives most excellent results.

Where newly cleared land is plowed just before seeding, it is best to disc it thoroughly and then use a spike tooth harrow to smoothen the surface as much as possible. Be sure to remove roots, stones, and other foreign matter wherever convenient. Seed broadcast at the rate of about two pounds to the acre. It is very important to secure a good stand. Where drilled, from one to one and one-half pounds to the acre will do. Drill in rows where land is fitted best, at two and a half feet distance between rows, and thin one plant to every ten or twelve inches apart in the row.

Wis. College of Agriculture. J. F. WOJTA.

Certified Milk

"There is no way on earth of getting dirt out of milk equal to keeping it out."

This is the slogan that Barney Sheridan has popularized in the sale of certified milk in the city of Fond du Lac, Wisconsin. He tells his customers that milk is a food and not a medicine; that there is no "process" that is equal to keeping everything clean. He frankly says that the employment of methods that assure an absolutely clean product must, of necessity, entail additional expense and consequently an additional charge.

It is by the production of clean milk at Luxerin that Mr. Sheridan has been enabled to create a greater demand than his 40 Guernsey cows are able to produce. He says that more than 1,300 babies have been raised on milk from his farm and that there has never been a baby lost that was fed exclusively from his herd from birth.

A recent attractive circular contains an illustration of the beautiful farmstead at Luxerin, together with appropriate photographs of babies and of the Guernseys that produce the milk. One significant statement that is played up in the circular is, "Milk is the most important food given to man." Another statement says: "Surveys show there are three times as many children under-nourished among well-to-do families, due to lack of proper understanding of the food value of milk, as there are by reason of poverty." It tells not only the particular story of clean milk but also contains the special values of Guernsey milk, which Mr. Sheridan presents in the following form: "Take a quart of Guernsey milk, add to it a pint of water and you will find you have the equivalent of one and one-half quarts of ordinary market milk—in addition to which there is a special flavor and color in Guernsey milk contained in no other milk."

Pure Alsike Clover Seeds

HOARD'S DAIRYMAN:—Too much emphasis cannot be given to the warning of the Wisconsin Department of Agriculture concerning the prevalence of Canada thistles in alsike clover. While the law permits the sale of crop seeds containing not more than one noxious weed seed to three thousand crop seeds if properly labeled, this still allows a serious infestation.

Alsike is usually sown alone at the rate of eight pounds per acre. The seeds are very small and there are approximately 688,000 seeds to a pound. At the eight-pound rate, 5,504,000 seeds would be sown on an acre. If the seed contained one Canada thistle seed to 4,000 clover seeds they would be sown at the rate of approximately 1,375 Canada thistle seeds to an acre. If all the seeds grew the farmer who purchased and sowed such seed would have work to keep him busy for several years especially if the thistles gained a foothold or, rather, roothold before being discovered. Infestation at the rate of 1 to 4,000 is at the rate of .025 of 1 per cent. What would happen if 1% of the seed was Canada thistle seeds? The clover seed might still be 99% pure.

It is almost impossible to separate Canada thistle seeds from alsike clover seeds even with the most improved cleaning machinery. Farmers who raise alsike seed on Canada thistle infested land ought to be extremely cautious about selling such seed to their neighbors or anyone else except a wholesale seed dealer who can dispose of it where it will do little or no damage. South of Mason and Dixon's line Canada thistles are out of their natural environment and do not thrive. Hence, clover seed infested with their seeds can be used there with no danger of permanent injury to crops or fields.

Better yet, no farmer should raise alsike clover for seed on a field which is infested with Canada thistles. If there are no clean fields on the farm and alsike is the best paying cash crop that can be raised, then some method should be adopted to remove the thistles before the clover is sown on the field. Plow the field as early as possible in the fall, keep it cultivated so the leaves of the thistles never show, this cultivation to be kept up until the ground freezes. The major portion of any plant's food comes from the soil but must pass through the leaves and changed by the action of the sunlight before the plant can use it for building up its tissues. Every time leaves appear above ground plant food is manufactured for the root of the thistle. Keeping plant food from being produced starves the underground parts. The field should be plowed again in the spring and thoroughly worked before seeding to grain, clover, and grass. If the work has been well done it is not probable that many Canada thistles will appear in the grain. However, if the thistles are very bad it would be better not to put grain and grass on the field but to plant it to corn taking great care that no thistles are allowed to grow in the corn.

In any case if thistles are growing in an alsike clover field and the clover is left for seed, some attempt should be made to cut off the thistles before they go to seed. Nearly all, if not all, the modern mowers are so constructed that the cutter bar can be raised high enough to pass over the clover but cut off the thistle tops. Even if this process results in some loss caused by the passage of the team and mower over the field it will usually be more than offset by the higher price obtained for the clean seed. Alsike seed free from thistle seed commands a premium at the present time. A recent occurrence will illustrate the point. The seed inspector visited the pl nt of a prominent Wisconsin seed house and found there several sacks of alsike clover seed of beautiful color and excellent quality except that it contained Canada thistle seeds. Pure alsike of the same grade was quoted at twenty-five cents a pound. This particular lot was purchased from the farmer at nine cents a pound. The seedsman was cleaning the seed over a gravity machine, a very slow process, and expected the cleaned seed to sell at wholesale at about 18 cents a pound. Even then he would probably have to label it as containing a "trace" of Canada thistle seeds because he could not be absolutely certain of getting the thistle seeds completely out of it.

It seems clear that the claim made by many seedsmen that with certain kinds of seeds the only way to get the seed free from noxious weed seeds is to grow it on fields free from noxious weeds has some foundation in fact. The farmer who will sell his product at the highest price is the one whose fields are free from noxious weeds.

Each year seed dealers are becoming more cautious about handling farm seeds infested with the seeds of noxious weeds and are refusing to pay high prices for it and the producer who fails to recognize the fact and to govern himself accordingly will certainly be the loser.

Wis. College of Agriculture. A. L. STONE.

Pasteurized Milk for Babies

Am operating a farm specializing in registered dairy cattle and in pedigreed hogs. To date the dairy department has not made a satisfactory financial showing and we have under consideration changing the policy. It has been suggested that the dairy department specialize in the production of pasteurized milk for infants. Will appreciate a report from you as to your observation on the success of ventures of this kind. When writing, will appreciate your stating the nature and cost of the necessary pasteurizing equipment and the selling methods that should be followed in disposing of the milk; will also appreciate an expression of your judgment relative to the practicability of such a venture.

Minneapolis, Minn. S. K.

If it is desired to specialize in the production of milk for babies, it will doubtless be advantageous to investigate the possibilities of producing certified milk. There is no special reason for the establishment of a pasteurizing device where it is the purpose to develop a special trade of this character, as practically all milk sold in cities is now pasteurized and merely the question of pasteurization would not be a sufficient selling argument.

The requirements for the production of certified milk in the city in which the milk is to be sold can be ascertained by taking up this matter with the city health officer. The production of certified milk, as such, however, is not always a profitable venture, owing to the exacting requirements and the expense of complying with them. Of course, if one can develop a special trade that will pay the price for this product, then there is no question but what it will prove out in the final analysis. We apprehend that on this farm some of these requirements are already being complied with and possibly a change will not add so greatly to the production expense.

It is doubtful whether there is a sufficient volume of milk being produced on this farm to warrant the installation of the necessary pasteurizing outfit, which will include a heating device, a holding tank, and the necessary refrigeration or cooling machine. In other words, it is quite likely that with a small volume of business the overhead would be more than sufficient to offset the uncertain additional price secured for the product.

It would seem to us that if the dairy department is not making money, the present method of operation would bear close investigation; that is, either there is too high an overhead cost in the production of milk or else the dairy cows are not of the right capacity or are not being properly fed and cared for. It is unjust for us to pass any criticism at this distance because we cannot be conversant with all the facts, but it would seem that a careful and unbiased investigation would disclose wherein the present operation of the dairy department is weak and where it can be strengthened. There is no question but that the man who develops a special market will receive a larger reward for his services, but we must also remember that cost of production is a factor that is, to a large extent, in the control of the producer of milk.

Oct. 8-15—National Dairy Show at Minnesota State Fair Grounds. Manager, W. E. Skinner, 910 So. Michigan Ave, Chicago.

Oct. 31 to November 5. Association of Ice Cream Supply Men, Buffalo, N. Y. Roberts Everett, 1328 Broadway, New York City, Secretary.

Food Value of High and Low Testing Milk

HOARD'S DAIRYMAN:—I am a producer of Guernsey milk and so your recent reply to an inquiry concerning the food value of milk of different tests interested me particularly. I quite agree that the consumer is hard to convince with this kind of reasoning and that perhaps the first appeal should be to the healthfulness, the palatability, and the attractiveness of Guernsey milk. None the less, he should be further advised as to the greater food value of the higher testing milk.

After your discussion I was interested in preparing a series of tables showing the food value of milk of different tests according to the methods suggested. I have used 3.8 per cent milk in establishing the basic price, as this is about the grade of milk usually sold to consumers in the city. I have found that, under the fat plus six-tenths method, that a quart of 5 per cent milk is worth 12¾ cents when a quart of 3.8 per cent milk sells for 10 cents. On the basis of total nutrients, the quart of 5 per cent milk is worth 12 cents when the 3.8 per cent milk sells for 10 cents.

The accompanying tables give the comparative prices of milk of different tests when computed on the basis of a standard price for 3.8 per cent milk, using both the fat plus six-tenths method and the total nutrients methods. These tables may be of interest to other readers:

Table I—Comparative Values Per Quart of Milk of Different Tests Based on a Standard Price for Milk Testing 3.8%. This Method of Comparison Uses the Well Known Cheese Factory Rule that Six-tenths % Plus the Fat Test of the Milk is the Best System of Paying for Milk According to Its Cheese Value. To Get Comparisons on the Basis of 100 Lbs. of Milk, Multiply the Prices Here Given by 46.33.

3%	3.5%	*3.8%*	4%	4.2%	4.4%	4.6%	4.8%	5%

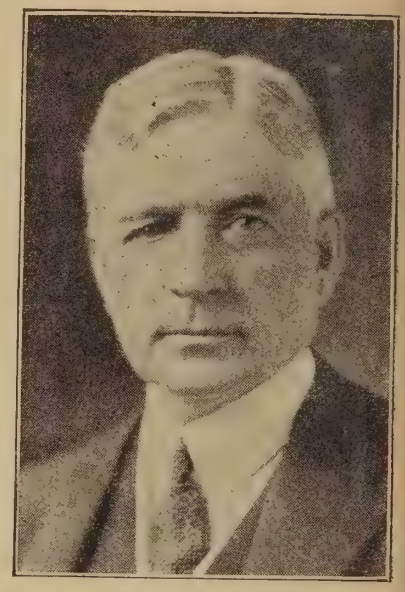
Wisconsin. JOHN S. CHARLES.

Minnesota Testing Fee Lowered

M. H. Fohrman, retiring superintendent of official testing in Minnesota, announced that July 1 a reduction in testing rates took place. One-day tests will be made for $8.75 per month, two-day tests for $13, seven-day tests for $31.25, and extra days $3.75. Saving made by a cut in the salaries of supervisors is passed on for the benefit of dairymen.

Mr. Fohrman has resigned his position at University Farm to accept an appointment with the Dairy Division of the United States Department of Agriculture. His headquarters will be at Washington. He will be succeeded at University Farm by E. O. Hanson, the former incumbent of the position but more recently with a Minneapolis commercial concern. The change was made July 1.

Thirty-eight supervisors worked during May in Minnesota and 1,058 tests were completed. One hundred seventy-four cows in 63 herds on yearly test produced more than four pounds of fat in two days. This meant that nearly two out of every three herds doing test work had at least one animal good enough to produce at the rate of two pounds of fat per day or better. Forty-seven cows produced more than five pounds of fat in two days on yearly test, and seven exceeded six pounds. More than one-fifth of the yearly cows produced four pounds of fat or better in two days.—Minnesota College of Agriculture.



A Montana View

The dairy industry is a great national institution fundamentally essential, economically sound, and morally up-lifting. It is only fitting that each year a great national show should be assembled to commemorate the achievements of a great humanitarian effort. It is a great clearing house of service.

One of the first and best features of the show is the ingathering of the best representatives of the various breeds of dairy cattle. The cow is recognized as the backbone of the dairy industry and always must be the foundation on which the industry is built. Many a man has been inspired to greater efforts in advancing the breed of his choice because of the knowledge and friendship he has gained from a visit to the National. The fact that the leading breeders of the nation continue to send their animals to the show each year is evidence that they must get a growing satisfaction from the fact that they are rendering a genuine and lasting service to humanity in having a small part in the upbuilding of a great productive enterprise.

The young man can find a great fund of information which will aid him in fixing his aim on a life work. He will find a source of real inspiration and encouragement in observing what his elders have done. It will aid him in renewing his efforts to carry on the work so well begun, with greater hope to excel.

The show is to be held on the Minnesota Fair Grounds this year, October 8th to 15th. We are glad to have it just so much closer to our state, as many more people from Montana and other northwest states will be able to attend.—G. L. MARTIN, Montana.

FRANK O. LOWDEN

Frank O. Lowden of Oregon, Illinois, recently elected president of the Holstein-Friesian Association of America, was born at Sunrise City, Minnesota, January 26th, 1861.

He graduated from Iowa University in 1885 and the Union College of Law, Chicago, in 1887. He practiced law in Chicago until 1906, teaching law at Northwestern University part of this time. He was elected to Congress November 6th, 1906, to fill the unexpired term of R. R. Hitt. He was re-elected to the Sixtieth and Sixty-first Congresses, serving from 1907 to 1911. He was a Lieutenant Colonel in the First Illinois Infantry in 1898. In 1917 he was elected governor of Illinois, serving until 1921.

Sinnissippi Farms, owned by Mr. Lowden, are located at Oregon, Illinois, and his home is upon these farms.

Washington Farmers Honored

Three farmers were this year awarded Certificates of Recognition by the State College of Washington for outstanding achievements in some line of agriculture. This is the first year the college has given formal recognition to agricultural leaders.

The three men are: F. M. Rothrock, breeder of Shorthorn cattle and leader in the live stock industry in the Northwest.

A. A. Kelly, horticulturist, who has done much as a member of the legislature for the fruit industry of the state through his work for nursery inspection.

Alexander Todd, member of the firm of William Todd & Sons, breeders of Holstein cattle. Many noted animals have been bred on the Todd farm, among them the two 30,000-lb. cows, Cascade Johanna Illustrites and Cascade Fleta Johanna, the former of which also holds the world's record for one-day milk production with 161.4 lbs.

Other cows of note from this farm are Cascade Marie, with a record of 28,724.5 lbs. of milk and 886 lbs. fat; Cascade Blossom, with a 305-day record of 24,043 lbs. milk and 764.8 lbs. fat, the milk record standing as a world's record; Cascade Pietertje, 22,062.7 lbs. of milk and 731.6 lbs. fat, as a junior two-year-old; and Cascade Pauline Mercedes, now owned by the Long Lake Stock Company of Minnesota, and making a wonderful record as a senior three-year-old.

Washington. E. G. WOODWARD.

THREE MEN GIVEN CERTIFICATES OF RECOGNITION BY THE STATE COLLEGE OF WASHINGTON FOR ACHIEVEMENTS IN AGRICULTURE

Reading from left to right: F. M. Rothrock, A. A. Kelly, Alexander Todd.

Hawthorn Dairy Maid, champion five-year-old Swiss cow with a record of 17,905.2 lbs. milk, 733.74 lbs. fat, and her three daughters. The oldest daughter as a three-year-old has produced 11,278.4 lbs. of 4.2% milk in 9 months.

A Brown Swiss Herd's Record

CHESTER G. STARR, ILLINOIS

THE Hawthorn Farm of Illinois, of which Mr. Daniel Insull is the owner, has recently completed three years' records in the cow testing association of Lake County. Forty-two cows are included in the record. Of these, one is a grade Brown Swiss, the other forty-one are all pure-bred.

As an average of the three years, the entire herd averaged per cow 7459 pounds of milk with an average fat test of 4.16 per cent or 310.3 pounds of butterfat. These records running over a period of three years and for a herd of over forty individuals are well worth considering. How many herds of like size over as long a period can equal this record?

It may be said that the herd was not pushed for very high individual records. Just good care and feeding were used. In studying the individual records of the cows the uniformity of records is rather high and also the absence of any forced records noticeable. Only two cows during the three years averaged over ten thousand pounds of milk. Eight cows averaged over nine thousand and sixteen averaged over eight thousand pounds of milk per year. Eleven cows made 350 pounds or more of butterfat. Twenty-six cows of the herd produced 300 pounds or more. Only two cows fell as low as 200 pounds.

The Brown Swiss cow may not give enough milk to fill the Atlantic ocean but on long time, persistent records she can be counted on as a strong contender in the producing race.

Mary of City View has produced 18,579.6 pounds of milk with 659.72 pounds butterfat, officially tested, in 365 days and carried a calf 8 months of her period.

Hawthorn Neva K. is now on official test as a two-year-old. In ten months she has produced 12,429.9 pounds of milk with a test average of 4.2%.

A Good Time to Buy Good Stock

HOARD'S DAIRYMAN:—I have never seen a better time to buy good stock at reasonable prices than this year of 1921. Recent sales have indicated that while prices are comparatively low, especially for first class dairy animals, still the very good ones bring good prices. This proves that quality is always appreciated even during a low priced period.

When we consider the few really excellent animals, and realize that it requires long years of breeding and selection to develop a superior herd, we must admit that the prices of the superior animals are low. A young man now with a small outlay of money can select some very choice animals at a very reasonable figure, and he would certainly do well to secure them.

When prices were high for dairy products there was little incentive to cull the herd. The chief ambition of most producers was to increase their volume, and less attention was paid to the profit and loss side of the individuals of the herd. Now we have arrived at a time for culling, at a time for the best, and certainly at a time when we must give good care and attention to our best. Consumption of dairy products is largely increasing. The value of dairy products as a food is being recognized in the average home. This will develop a good stable market, and with the present emergency tariff we certainly can expect this. Milk and butter substitutes are being consumed in much smaller quantities than a year ago, while some states are regulating these substitutes so that their consumption will undoubtedly be curtailed.

In the future it will be necessary for the dairyman to devote more attention to the individuals of his herd and to their care and management. Better housing and modern machinery of all kinds will be brought into use. We can compete with foreign production providing we use a better milk producer in the form of a better cow. Feed this cow economically and wisely, and use modern equipment and labor saving devices in our work; this is the way we have always been able to compete with foreign competition.

It would pay many of our dairymen to get rid of some of their inferior stock and select a few good ones. The whole world is short of the extra quality, and there is always room and good prices for anyone who can produce a superior article, whether it be a domestic animal or an article of manufacture.

Motor Cultivation of Crops

J. L. JUSTICE, INDIANA

A FEW short years ago when it was announced that farmers could cultivate their corn with tractors in place of horses many were skeptical in regard to doing it successfully. While some have done excellent work with their motor cultivators, and will continue to do so, there still continue to be many who refuse to concede that satisfactory work can be done with a motor cultivator.

I always liked the idea of motor cultivation before ever we used one here on the farm or before I saw one. I went to see the first one work on a neighboring farm, and as it was cultivating in nice corn a foot or more high it was freely stated by observers that it could not do good work in real small or real large corn. When I saw them running along successfully and doing work that would have been a credit to a good many horse drawn cultivators in both small and large corn I was satisfied that motor cultivation was a thing that had fully arrived and was due to become popular if the cost of operation could be kept on a par with horses or made cheaper than horse cultivation.

Our tractor is of the two-wheel type in which the implement that is being operated by it forms the rear of the tractor. When the plows are removed the cultivator attaches directly to the tractor, becoming a part of it in a compact motor cultivator as shown in the accompanying illustration. This is a two-row cultivator. This is one of the features that makes motor cultivation as economical as it is. It is doubtful whether one-row motor cultivation will soon become an economy, nor is it necessary except in places of stumpy or stony ground or anywhere that a two-row cultivator will not work to advantage.

The successful use of a two-row cultivator, whether horse or motor drawn, depends on the proper preparation of the soil and the care in planting. Disappointment follows when one tries to cultivate in trashy or cloddy ground. The greatest trouble is experienced in stalk ground that has been poorly plowed, with stalks left on top or sticking up between the furrow slices. A single-row cultivator is much easier handled under such circumstances. The ideal ground to use the two-row cultivator on is the smooth, well pulverized seedbed. When you have made a good seedbed the way is well paved toward successful motor cultivation. I have seen the two-row cultivator condemned one year and praised the next, and this difference of opinion was caused by a difference in the making of seedbeds, a condition which the owners freely admitted.

The chief attention required in planting is to keep the rows as straight as possible and to make the cross-check as uniform as possible by watching the tension of the planter chain.

There is one feature we have found to be a distinct advantage over horse cultivation, that is the slow steady speed that can be attained when cultivating the small corn the first time over. The speed can be modified by a simple pressure of the fingers on the speed indicator right in reach of the operator, and there is no wavering or jerking of the cultivator as sometimes takes place when horses are used. There is that steady pull on the cultivator whether the shovels be set deep or shallow.

It is but natural to suppose that a great deal of corn will be knocked down on the ends, but there is no more knocked down than is done with horses with a two-row cultivator There are three other motor cultivating outfits right here in the neighborhood and I cannot see but that all raise as much corn on the ends as do the rest of the neighbors. I have seen some farmers ruin most of the corn on the ends, so the amount of corn destroyed with the motor cultivator depends more on the skill and care of the operator and less on the type of cultivator.

This motor cultivator has given satisfactory service and has proven to be efficient in cultivating row crops where properly planted.

O' the Farm That's Mine!

O' the farm that's mine! O' the farm that's mine!
The whinny of the horses, the lowing of the kine;
The cheeping of the chickens and the cooing of the doves
As they return again to the nest that each one loves;
When the spring is just beginning, and we're getting into line,
For the happy time of planting on the farm that's mine.

On the farm that's mine, beside the tinkling brook,
Where the fishes idly linger in ev'ry shady nook;
And the birds are always singing in the treetops on the bank,
Where the vi'lets nestle softly and the moss is deep and dank;
And the children scamper gaily o'er the meadow green and wide,
As they gather sweetest flowers growing free on ev'ry side,
And their cheeks are red and rosy (for they lack no vitamines),
And they glory in the summer on the farm that's mine.

O' the farm that's mine, O' the farm that's mine!
Where sun and rain, and rain and sun cause everything to shine;
The freshness of the atmosphere and ev'ry fruit and flower.
And something new and wonderful enhances every hour;
For the city's din and pleasures, for its follies I'll not pine,
While I'm living in the country on the farm that's mine.

—Vivian S. Watson.

More Good Plowing Per Day at Less Cost

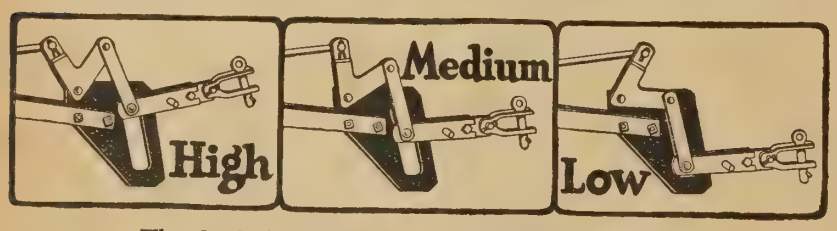
The John Deere No. 40 Tractor Plow, built especially for use with the Fordson Tractor, gives Fordson owners real plowing economy. It does unusually good work. And its unusually light draft means less expense for fuel and tractor upkeep — more acres of good plowing per day at lower cost per acre. Thousands of No. 40 plows in actual use with Fordsons are proving their ability to do the best of work at lower operating expense.

JOHN DEERE No 40
The PLOW with the SELF-ADJUSTING HITCH

Equipped with standard John Deere bottoms—they scour and do the work the way the farmer wants it done. There is a type for every soil.

Pulls extremely light because of the good scouring qualities and high-grade construction of its John Deere bottoms; its rolling landside; its light weight; its rigid frame; its snug, smooth-running bearings, and its self-adjusting hitch.

Watch the No. 40 at work in the field, and you will readily appreciate how light draft it is.



The self-adjusting hitch is an important and exclusive feature. When depth of plowing is varied, this hitch moves automatically up or down to the proper line of draft. Always—without any attention from the tractor operator—**the hitch is correct.** Bottoms run true and level at all depths, doing good work and pulling light all the time.

The rolling landside on this plow is a great draft-reducer. Revolving on a greased, smooth-running bearing, the rolling landside entirely eliminates sled-like friction because it carries both furrow wall and furrow bottom friction in a rolling motion.

Flexible link clevis insures even plowing in uneven ground—keeps the up-and-down action of the tractor from affecting the work of the plow.

New-Process John Deere steel in beams, braces and axles—steel that is extremely hard, tough and strong—provides an unusual combination of light weight and great strength. **Beams are guaranteed not to bend or break.** Frame connections are hot-riveted—no "give" anywhere.

Be sure to see this fuel-saving, thorough-working plow built especially for the Fordson. Send today for a free booklet describing it. A postcard will bring it to you. Address John Deere, Moline, Illinois, and ask for Booklet NF-714.

When depth of plowing is varied the self-adjusting hitch on the No. 40 moves automatically up or down to proper line of draft —a big advantage in maintaining good work and light draft.

JOHN DEERE

THE TRADE MARK OF QUALITY MADE FAMOUS BY GOOD IMPLEMENTS

1921 Will Reward SUMMER FEEDERS

"What sort of magic feed is *grass* that it should be considered a perfect feed for dairy cows? The answer is that grass is practically hay with water in it, and what farmer that even pretends to keep cows would think of feeding his stock on moist hay all winter? Yet that is all the feed the poor cow usually gets throughout the summer."—*A. C. Palmer in Hoard's Dairyman.*

International Special Dairy Feed

The first flush of milk resulting from green pasture is passing. From now on cows not receiving additional feed must draw on their bodily reserve to maintain milk flows.

A small ration of International Special Dairy Feed, in addition to grass will work wonders. Maintains milk flows and sends cows to the barn in top condition in the fall. The price is right.

Write us if your dealer cannot supply you.

INTERNATIONAL SUGAR FEED CO.

Minneapolis, Minn. Mills at Minneapolis and Memphis

LIVE AGENTS WANTED

What's the Matter with Us?

(Continued from page 956)

or otherwise is such that the arrangement can be made.

"The farmer is fast learning that economical transportation will do much to increase the chances of a profit on his farm. Therefore, he is interested today, more than ever before, in the farm-to-market roads rather than highways built for pleasure.

"The farmer is finding that he must follow his products a little closer to the consumer. Therefore, he is interested in rail and water transportation especially when he finds that the price of his wheat is based upon the Liverpool market, and if the ocean waterways could be opened into the Great Lakes so that sea-going vessels could land in the various harbors of the Great Lakes, it would enable the placing of wheat on the Liverpool market at from 10 to 12 cents per bushel less than it is now being handled.

"Somehow the impression has gone out that the American Farm Bureau Federation intends to go into the mercantile business in the buying and selling of farm necessities co-operatively. Such is not the case. The American Farm Bureau Federation as an organization cannot engage in commercial activities. It feels, however, that the one big job for the farmer is to sell his products in a businesslike way, and if he does that he will be able to buy satisfactorily.

"We believe in the building up of community centers. We need service stations in those community centers that will provide the necessities of comfortable living. Every merchant, therefore, is a service station and the success of his business depends upon the service he renders the people of his community. Then, just so long as that service is efficient and the people of the community are happy and contented, he need fear no competition. However, when ever dissatisfaction appears in the community and there is talk of co-operative stores being set up, then it is time for that merchant to sort of take an invoice of the situation and analyze his business, because it is very apparent that that service station is not filling the needs of the community.

"It takes capital to be a farmer under present conditions. We need a financial system built on a thorough understanding of the farmer's needs. A commercial men's bank is of small use to us. We do not do business on ninety days. Our turnover is annual, and when we raise live stock, runs from one year to five.

"A careful study of the situation, through several months by the American Farm Bureau Federation through its various committees, results in the advice to all country banks to become members of the Federal Reserve System. However, to be of any value to the farmer there must be an extension of the time of credit. According to the Federal Reserve Bank Bulletin, the average time of maturity for the month of March, 1921, was 12.38 days and for February was 9.53 days. You men know how much benefit such a term of discount would be to the farmer who wanted to feed a carload of steers, and it is not at all surprising that the statement of the Federal Reserve Bank of volume of bills discounted during March, 1921, shows in all the districts $85,580,480 total agricultural and live stock paper out of a total discount of $7,345,054,449, or 1.1 per cent. It is no doubt true that there was a large proportion of farmers' paper included in member banks' collateral notes, but with this low average period we are

Western Canada Offers Health and Wealth

Save your temper, your cows, your milk. Does not excite the cow, nor disturb the flow of milk. Indispensible for breaking heifers, cows with sore teats, or vicious kickers. Cannot wear out. Put on or off in 15 seconds. Guaranteed to be an absolutely perfect anti-kicker, or put on loosely as hobble for cow, horse or mule. Price $1.15 Postage extra. Weight 2 lbs. Send for it **today**, when you need it you won't have time.

DAIRY EQUIPMENT CO.
Dept. H. Topeka, Kansas

further confirmed in the impression that the agricultural paper handled by the Federal Reserve Bank is insignificant in proportion to that of industry. To serve agriculture properly, the Federal Reserve must extend its agricultural rediscount period on grain crops to nine months, and on live stock paper to two years. Some way must be devised so that this can be done without seriously congealing credit. With this amendment the farmers of this country would at once receive tremendous benefit.

"Legislation from the standpoint of the farmer does not mean class legislation or politics. However, there are some things relative to building up America's greatest industry—that of agriculture—in the enactment of measures that will put agriculture on a business basis. Our legislative office in Washington, under the direct supervision of President Howard, an Iowa farmer, and our executive committee of twelve, is rendering fine service for the farmer, especially since the agricultural blocks of the Senate and House were organized. We do not lobby. We present facts. We get the will of our people and lay it before Congress.

"The farmer does not want to drag other lines of industry into the ditch beside him. He wants you thoroughly to understand his problems and stand shoulder to shoulder with him until the wheels of industry again begin to revolve at full speed and prosperity and happiness come to our whole country. Anything which organized agriculture proposes is based on the idea of 'doing to others as you would have them do unto you'. Our whole co-operative marketing program is based on a sound, thorough analysis of business conditions. Our legislative program is builded from the thoughts of the sane, safe agricultural interests of the country. Our organization is builded with the same thought in mind, and if these conditions can be righted it will mean not only more products on the farm, but better equipment, better homes, better schools, and better churches, and, above all, a better class of citizenship when the farmer and the commercial interests once learn to understand each other."

Eastern Guernsey Notes

HOARD'S DAIRYMAN:—Over 200 breeders of Guernseys of Cayuga and Tompkins Counties, New York, with their families, met for a picnic and "talk-fest" about yellow cattle last week.

C. G. Meeker of Auburn invited his fellow breeders to meet at his farm home near Owasco. The latter were glad of an opportunity to inspect the Meeker herd which ranks high in Guernsey circles. Earl Crockett, chairman of the Cayuga County Guernsey Club, presided. This county stands second in the United States in Guernseys, Waukesha County, Wisconsin, claiming first place.

Professor H. C. Royce, a Guernsey breeder and a member of the department of Animal Husbandry at Cornell College of Agriculture, was one of the speakers. Professor Royce was one of the men who helped Professor Babcock perfect the now well known Babcock test. In his opinion but few new things have been brought out in late years relative to breeding. Most of the results to be expected were known 30 years ago. He believes Guernsey breeders should not tie too closely to any special strains unless assured they are really the best.

"Pure-bred cattle are valuable only in so far as they will breed true," he said, "and I suggest using only those that will do so. I am a firm believer in advertising, but you want to advertise where there is need of the stuff you have to sell."

Professor Royce was one of several dairymen of Tompkins County to volunteer to donate valuable bull calves to such dairymen as would use them in their herds as sires in place of scrub sires, so much faith has he in the increased benefits to be derived from better breeding principles.

On June 30th the Onondaga County Guernsey breeders held their annual picnic at the Seneca River Guernsey farm owned by J. H. Kelly. Cayuga County breeders united with them in discussing mutual problems.

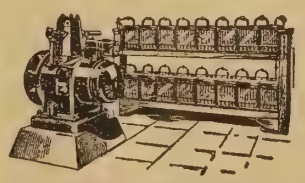
Dryden, N. Y. E. F.

Name your farm and place a well painted sign up over the gate. Then use the name on every occasion. That's one of the best ways of creating a reputation for your produce.

Willys LIGHT

*Power and Light with the Quiet Knight

$525



There never was such a remarkable reduction in price as this. Here is a practical power and light plant which is admittedly superior in every sense.

—And yet so reasonably priced that every home in North America can now have the convenience of electricity.

Precedent has been swept aside in meeting what we consider our obligation to the American farmer—giving him the benefits of our tremendous purchasing power, sound engineering and manufacturing economies in this electric plant highest in quality yet lowest in price.

Willys Light is an established success. One exclusive superiority alone, the Willys-Knight sleeve-valve engine, is of itself a sufficient reason for buying *only* Willys Light. In addition it has fifty distinct advantages.

Thousands of homes where electric current is not available will take advantage of this opportunity *now*. See your Willys Light dealer—there is one near you.

*The Willys-Knight sleeve-valve engine

The famous air-cooled Willys-Knight Engine burns kerosene, cranks itself, stops automatically, and "improves with use".

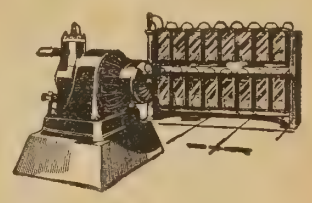
Every Home Can Now Have Electricity

Willys LIGHT JUNIOR

$295

Here is the "eighth wonder" of the farm power and light world—Willys Light Junior.

It is large enough for lights and small power uses, and more important—it is low enough in cost for every purse and person.



Neat, compact, made with the high quality which characterizes *all* Willys Light products—its very name is a pledge of satisfaction with nation-wide service behind it. It has the wonderful Auto-Lite engine generator, and long-lived dependable battery.

Could there be any greater evidence of our intention to place our entire resources and production capacity at the disposal of every farm home?

Farms that were formerly denied electricity will glisten with safe, clean light at the snap of a switch.

Ask your Willys Light dealer about Willys Light Junior, or write for booklet.

Willys Light Junior has the wonderful Auto-Lite engine generator, a battery of ample capacity and is of standard voltage.

Washington, D. C., Weekly News

[SPECIAL TO HOARD'S DAIRYMAN]

WASHINGTON, JUNE 27—Hearings on the cold storage bill were closed at the end of an all-day session of the House Committee on Agriculture last Friday, the committee sitting until seven p. m. to hear all the representatives of the cold storage interests. In the forenoon representatives of the dairy industry were given ample time to put their case in opposition to several of the provisions of the bill.

Dr. George L. McKay, of the American Association of Creamery Butter Manufacturers, was the first witness. He gave the committee much detailed information as to the effects of cold storage on butter, the principal point he made being that it was not the time in storage which was the controling factor in the quality of the butter when it came out of storage. Professor Christ Larsen of the Illinois Agricultural Association followed Dr. McKay. He did not favor marketing butter products and thus reducing the prices of the product to the public. If this is insisted on, he said, the cost of the marketing and the loss from lowered prices will fall on the producers. He opposed government inspection and certification unless safeguards could be provided as to the kind and experience of the inspectors who might operate the inspection machinery.

M. D. Munn of the National Dairy Council told the committee that whatever hardships this bill, or whatever bill they passed, worked would fall back on the producers of butter, now suffering from inability to get cost of production. He admitted the demand for marking food products for what they are, but suggested that dating alone was sufficient to identify butter. Butter, he said, is always sold on grade, and any further labeling marks would only serve to depress prices without compensating advantages. John J. Farrell of the National Dairy Products Committee opposed placing butter within the operation of the cold storage law at all. He analyzed the law as to its economic as well as health objects, and showed that in his judgment he thought butter was never hoarded and was sold now on its merits and without commercial dishonesty.

A. M. Loomis, secretary of the National Dairy Union, was the last witness for the dairy industry. He analyzed the law to show that it was apparently intended to provide for four objects: standardization of cold storage warehousing, prevention of hoarding, necessary government reports, and labeling. As to the first three objects of the bill, he was in favor except as to details, suggesting that a temperature of 40 degrees instead of 45 degrees should be named as standard, and that while he had never had the evidence that butter was hoarded in cold storage to depress the next season's markets, yet it might be good public policy to prevent this by law, and so he favored a twelve-month limitation, but wanted the time limit to date from the moment the butter was packed, not after sixty days of "kiting". He objected to making public records and authority to publish reports of ownership of butter in storage, or of other products, or of loans on such stocks, saying that this information, if required in reports, should be confidential, and to be disclosed only upon the request of Congress. As to labeling, he pointed out that if butter must be branded "Cold Storage" it handicapped all storage butter, no matter how high its quality, in its competition with oleomargarine, as margarine is made as the market demands, and would never become subject to a cold storage law, with the thirty or sixty days grace provided in the pending bill. He said that the public has the right to demand that all food be sold for exactly what it is, but that stamping the date of packing on a package of butter certainly told all the facts necessary unless a system of government inspection and certification were adopted. He personally favored this latter system, while realizing the difficulties in the way of securing its full and complete establishment.

The cold storage people in the afternoon asked for a law covering all food products except those cooked or otherwise cured. They asked for the dropping of the voluntary inspection system, suggested and added to the bill by Chairman Haugen. They wanted lard, lard substitutes, and vegetable oils excluded from the bill. Ten or fifteen other amendments were suggested. The committee heard all witnesses who were here, and then deferred further action until the hearings are printed and ready for the members of the committee.

⚜

All dairymen are interested in good roads. The Dowell Phipps bill was called up and passed on Monday, under suspension of the rules, by a vote of 206 to 77. The Townsend bill is expected to be called up in the Senate any day now, and is quite sure to pass. This will put the two bills in conference. The grave danger is that because of the fight between advocates of each bill, and a third opinion which holds that no money should be spent by the government for road building, there will be no legislation at this time.

⚜

The Packer control bill has gone to conference between the House and Senate, the conferees being Senators Norris, Kenyon, and Kendrick for the Senate, and Congressmen Haugen, Ward, McLaughlin, Jacoway, and Rainey for the House. The House conferees are expected to stand out firmly for the elimination of the Senate amendments, the principal one of which, that requiring uniform accounting, is regarded by the friends of control legislation as the strongest feature of the bill.

⚜

Secretary of Agriculture Wallace now has five positions of importance to fill in his department, another having been added this week by the resignation of George Livingstone, chief of the Bureau of Markets.

⚜

"Filled Milk" legislation will come up in Congress again early in July, the date not yet set. Two other matters have the right of way in the committee on agriculture: the spring wheat grading bill and the sugar claims resolution.

⚜

"Hides go on the free list" is the latest dictum from the Ways and Means Committee. They also say that shows are to go on the free list. This makes the dose easier to take. As a matter of fact when it is necessary to import hides to supply this country's need of leather, and in the face of a shrinkage in numbers of beef cattle which will make a seller's market probable within another year, the tariff on hides has lost most of the arguments that once existed for it.

⚜

The lumber schedule seems to be compromised, but it is said that a fight is to be had on this item in the Republican caucus. The caucus is for free rough lumber, but ten per cent duty on dressed lumber. A strong fight is being made by Illinois, Minnesota, Wisconsin, and Dakota interests against any lumber tariff.

Dairy Manufactures Valued at a Billion Dollars

A summary of the general results of the 1920 census of manufactures for the butter, cheese, and condensed milk industry has been issued by the Bureau of the Census, Department of Commerce, showing for the United States as a whole, the quantities and cost of the principal materials used and the quantities and value of the various products manufactured in factories during the year 1919.

Returns were received from 7,857 establishments in 1919, the products of which were valued at $1,079,557,000. At the census of 1914, 7,982 establishments reported products valued at $370,819,000. While there was a decrease of 125 in the number of establishments, the total value of products increased $708,738,000, or 191.1 per cent, from 1914 to 1919.

Butter and Cheese—The production of butter in 1919 amounted to 938,505,382 lbs., valued at $533,331,000, as compared with 786,013,489 lbs., valued at $223,179,000 in 1914, representing an increase of 19.4 per cent in quantity and 139 per cent in value. The production of cheese in 1919 amounted to 475,330,820 lbs., valued at $137,281,000, and in 1914 to 377,506,109 lbs., valued at $50,932,000, the increase being 25.9 per cent in quantity and 169.5 per cent in value.

Condensed and Evaporated Milk—The production of condensed and evaporated milk increased from 884,646,761 lbs,. valued at $59,375,000 in 1914, to 2,096,973,252 lbs., valued at $293,569,000 in 1919, the increases in quantity and value being 137 per cent and 394.4 per cent, respectively. The manufacture of powdered milk increased from 21,987,911 lbs., valued at $2,082,000 in 1914, to 106,691,388 lbs., valued at $17,273,000 in 1919, while for the same period the production of sugar of milk increased from 4,051,320 lbs. valued at $401,000 to 10,401,116 lbs. valued at $2,633,000. The production of both powdered milk and sugar of milk was first reported separately at the census of 1914. The accompanying summary gives comparative statistics for the milk and cream used and for the principal products manufactured in this industry as reported at the censuses of 1914 and 1919. The figures for 1919 are preliminary and are subject to such change and correction as may be necessary upon further examination of the original reports.

Butter, Cheese, and Condensed Milk—Comparative Summary: 1919 and 1914

		1919	1914
Number of establishments		7,857	7,982
Principal materials			
Milk	Pounds	10,244,874,792	8,431,632,860
	cost	$333,357,000	$114,315,000
Cream	pounds	2,551,748,117	2,383,828,265
	cost	$437,267,000	$160,917,000
Total value		$1,079,557,000	$370,810,000
Products			
Butter	pounds	938,505,382	786,013,489
	value	$533,331,000	$223,179,000
Cheese	pounds	475,330,820	377,506,109
	value	$137,281,000	$50,932,000
Condensed and evaporated milk	pounds	2,096,973,252	884,646,761
	value	$293,569,000	$59,375,000
Powdered milk	pounds	106,691,388	21,987,911
	value	$17,273,000	$2,082,000
Sugar of milk	pounds	10,401,116	4,051,320
	value	$2,633,000	$401,000
All other products	value	$95,470,000	$34,850,000

Includes for 1919, 189 establishments engaged primarily in other industries, while manufactured butter, cheese, and similar commodities as subsidiary products; and for 1914, 342 establishments of this class.

Jersey Day at Provo, Utah

Jersey week wound up in Utah by a big celebration at Provo, the recognized Jersey center of the Intermountain Country.

Breeders from all over the state were visitors on this occasion.

The day was started off with a parade a little better than half a mile long, and made up of some of the finest dairy stock, if not the very finest, ever seen in this state.

At about 10 o'clock the judges started work on about 200 head of pure-bred cattle most of which were of extra good quality. When the aged cow class was led in the ring the judge exclaimed: "This is the greatest exhibit of high class dairy cows ever seen in the ring at one time in the history of Utah." Forty-six fine dairy cows lined up in this ring in the aged cow class, which was ten more than the record show at the state fair.

The show was a success in every respect. A list of the exhibitors follow: Wasatch Farms, Ray Hinchcliff, Elmer Rouse, George L. McKenzie, James Malstrom, C. Y. Cannon, W. A. Nuttall L. M. Price, State Mental Hospital, A. O. Smoot, Parley A. Olsen, Geo. R. Meservy, Wells L. Brimhall, Ole E. Olsen, Jr., A. H. John, Scott Taylor, and F. L. Finlayson.

The ribbons were well distributed and the exhibitors seemed to be well pleased. Professor John T. Caine, Illinois, was the official judge, assisted by his brother Geo. B. Caine.

A student judging contest was conducted and prizes awarded to the competing teams.

Resolutions were passed thanking the American Jersey Cattle Club for the help it rendered in putting "Jersey day" over.

Specially written songs were rendered by the "Jersey day" quartette and made a "hit".

During the entire day the guests were furnished Jersey milk free with the compliments of the Jersey breeders of Provo. A Jersey booth was dressed up by the ladies of one of the wards of Provo and they sold milk, ice cream, sandwiches, etc., proceeds of which went towards erecting a church building within this ward.

Utah. A. O. SMOOT.

The Herd That Has Never Been Milked by Hand

IN the development and perfection of the Burrell Milker our Overlook Farm herd has played an indispensable part. This herd has been milked continuously with the Burrell Milker since 1904—seventeen years. It averages about fourteen cows, and contains no cow that has ever been milked by hand. In fact, every cow in the herd is at least of the *second* generation of machine-milked cows. The heifer shown in the insert is of the *third* generation that has never been milked by hand. She freshened last summer.

There is another cow in the Overlook herd whose record speaks well for the practicability of the Burrell Milker and its effect upon production. This cow, which of course has never been milked by hand, has not been dry for the past ten years. In 1917, she gave 2094.2 lbs. of milk in April, 2205.4 lbs. in May, and 1969.6 lbs. in June, and while giving this large flow of milk was milked only twice a day.

There are several other interesting facts about the Overlook herd. Production is maintained at a creditably high average. One man cares for and milks the whole herd of about fourteen cows, and handles the milk as well. Bacteria counts show that Overlook milk averages about 3000 per c.c; sometimes much lower, but seldom, if ever, above 10,000 per c.c. These spendid bacteria counts are made under very average conditions. There is no steam for sterilization, the hot water used for washing utensils being heated on the kitchen stove. This record of low bacteria counts is the result of properly using a sterilizing solution and following accepted principles of washing and drying utensils.

The milk from the Overlook herd, milked with the Burrell Milker, is bottled and sold in Little Falls as Grade A raw milk, and is acknowledged by local physicians as the one safe milk for infant feeding—well within the certified grade.

Association Notes

Wood County, No. 3, Wisconsin:—The 407 cows tested averaged 934 lbs. of milk with 31.95 lbs. butterfat. Six herds in the association averaged over 40 lbs. of fat. Three averaged over 45. Three registered Holstein cows, one heifer, and five grade Holstein cows were purchased. Due to the low price of cheese, farmers are not feeding grain to any extent. Pastures are not very good. Small grains and corn look very promising. Due to the low price of registered cattle, farmers are willing to dispose of their grades. Many are fine individuals. A carload can easily be picked up.

Stillaquamish, Washington:—Two pure-bred bulls were purchased and one milking machine was installed. During May market milk testing 3.6 per cent sold for $2.47 per cwt. The creamery paid 30c per pound for fat. Milk retailed for 10c per quart and butter for 32c per pound.

Southern York County, Pennsylvania:—One pure-bred Holstein bull calf was purchased to replace a grade. Seven unprofitable cows were sold and six men began to feed a balanced ration according to milk production. During May, market milk testing 4 per cent sold for $2.00—$2.30 per cwt. Milk retailed for 11c per quart. Corn sold for $20 per ton; oats, $30; cottonseed meal, $36—$42; oil meal, $40—$42; wheat bran, $36; brewers grains, $60—$70; gluten feed, $48.

Canyon County, Idaho:—This association is on the honor list for there is not a scrub bull at the head of any association herd.

Athens Co., Ohio:—Three unprofitable cows were disposed of in June. Twenty out of 22 members are feeding balanced rations. Twenty tons of feed were purchased co-operatively. Market milk sold for $4.30 per cwt. The condensery paid 32 cents per pound for fat and 80 cents per 100 lbs. skimmilk; the creamery paid 32 cents. Milk retailed for 13 cents per quart, butter, 40 cents per pound, and cheese 35 cents. Ground corn sold for $1.35 per cwt.; cottonseed meal, $2.20; bran, $1.40; middlings, $1.65.

Northfield, Wisconsin:—All separators were tested last month; five were not skimming efficiently. All but three members are using pure-bred bulls. Members have agreed to hold a meeting at the end of every month to talk over the progress of the association, compare methods of feeding, management, etc.

Mississippi Forms Association

That "queen" dairy cow is fast winning a recognized place on the throne beside "King" cotton in Mississippi is being clearly demonstrated in many ways throughout the state. One of the latest and most conclusive proofs of this fact occurred at Macon, Miss., recently.

Some of the representative dairymen of Noxubee County, realizing the importance of improving their herds and putting the dairy business of the county on a permanent and constructive basis, became interested in working up a cow testing association. Sixteen very much interested dairymen assembled in the lobby of a cotton broker's office for the purpose of organizing the cow testing association. The work of organization was soon begun with E. B. Boyd, "the cotton broker" and one of the sixteen signers of the agreement, acting as chairman of the meeting. This would have been considered "backsliding" for a cotton broker just a while ago. However, Mr. Boyd seemed to appreciate the distinction just as much as he could have a similar honor in a cotton meeting when "king" cotton reigned supreme.

The constitution and by-laws were adopted and seven directors elected, which body elected a president and secretary-treasurer from their number. T. S. Boggess was elected to the former position and Bruce Lunberg was elected to fill the latter. To Mr. Boggess is due much credit for the association being organized. Mr. Lunberg is a grandson of H. B. Gurler of Macon and now has charge of the dairy herd consisting of 120 cows owned by H. B. Gurler & Company. The association is made up of sixteen thorough bred dairy farmers and more than 700 grade and pure-bred Jersey cows.

Mississippi. L. A. HIGGINS.

A "Canner Cow" Makes Good

Last spring my neighbor sold a canner for three and one-half cents a pound to the shipper, but instead of sending this cow to Chicago the shipper sold her to a member of the Brooklyn, Wis., Cow Testing Association. This canner is now producing over 40 lbs. of butterfat per month.

By testing you know what every cow in your herd is doing, whether they are paying for their keep or if you are paying them for the pleasure of feeding, milking, and caring for them during the year. It has been said that it pays well, which is very true. But to fed well is not to simply fill the manger full of hay and straw, shock corn, etc., or any one or two things that happen to be handy. Last fall I was feeding my cows ground oats and barley, hay, and silage. I thought they were doing fairly well, but when the tester came to my place and had finished his day's work, I asked him if there was any feed that could be added to increase the

production. He advised me to add a sufficient amount of oil meal to balance the ration. I followed his suggestion and got splendid results, my herd averaging over 40 lbs. of butterfat for two consecutive months, making them the highest herd in the association. My advice to all dairymen is to push the cow testing association work with all possible speed.

Wisconsin. G. A. RASMUSSEN.

Discouragement Leads to Progress

When the tester of the Alto, Wisconsin, Cow Testing Association came to my place in 1916 I found out that I had a poor herd, mostly scrubs. That is, I had none going into the quality cow book making 40 lbs. of butterfat or more. My cows were of a mixed breed, but I was using a pure-bred Jersey sire. I started selling the boarders and raising the heifers from my best producing cows. This was a long, tedious job, and at one time I was getting so disappointed that I was going to sell the whole business and buy some pure-bred Holstein cows. I found that this would cost so much I decided to keep on as I was.

Last year my herd began to make some showing. I had a few in the 40-lb. class, and this winter my cows are doing fine, although I am not satisfied yet. In January I had eight cows making 40 lbs. or more of butterfat, and in February I had nine out of my sixteen. Another thing has been quite a study to me and that is the feeding, giving them a balanced ration and to know each cow and to know if she can stand a little more fat or protein as the case may be. If it had not been for the cow testing association I would not have the quality of cows I have today. The small cost of testing has certainly been a good investment for me.

Wisconsin. JOHN H. BRUINS.

High School Testing Association

HOARD'S DAIRYMAN:—The Logan County, Colorado, High School Testing Association is the only one of its character that is doing this type of project work for students in schools operating under the Smith—Hughes Act. The association was started here in the effort to find project material for a city boy who was not in a position to finance or carry on a project of his own. The association now has 10 herds containing 113 cows. One student has charge of each herd and he computes the usual monthly record.

We have been able to arouse interest in 7-day tests and have actually made the test for one dairyman. This has been the means of inducing two more dairymen to try out the official testing this fall. We have also assisted in locating pure-bred bulls and cows and have co-operated with the Domestic Science Department in making a dairy exhibit in one of the local stores.

I feel that the work of the association has been the means of bringing the college, dairymen, students, and their instructors in closer contact with one another. The work offers an opportunity for students to study the dairy business from the practical side as well as compare the business methods of successful and careless dairymen. I have also noted that the dairymen are taking a greater interest in the feeding and management of their herds and are really competing with each other that they may have the high herd or high cow for the month.

I believe the high schools that are offering Smith—Hughes work can help the dairy industry in their communities and at the same time educate students that are interested in dairy work so that later they will be of real value to some dairyman as a herdsman or milker.

Sterling Colo. H. A. S.

Pacific International Building

On April 4th construction was begun on the addition to the Pacific International Live Stock Exposition plant at Portland to provide housing sufficient to take care of as large an exhibit as was made at the 1920 show.

The building will be made to have a capacity for 750 beef cattle; 850 dairy cattle; 400 horses; 1,000 hogs; 1,000 sheep; 250 goats—with ample space for a poultry show and for boys' and girls' club exhibits. A machinery hall and a dairy products building will also be erected by the 1921 show November 5th to 12th. There will be a little over ten acres of space under one roof, making the building one of the most complete of its kind.

At the 1921 show a total of more than $75,000 will be offered in cash prizes. Advices already reaching Manager O. M. Plummer indicate that this year's show will be stronger than ever before.

Up hill all day on second!

DID you ever stop to think that the normal, everyday work a tractor has to do is just as hard on the tractor engine as a steady up-hill climb would be for your motor?

The tractor engine is built to stand it—provided it gets the right oil—the special oil that's made for tractors.

Texaco Tractoil, and a very reasonable amount of attention to mechanical details, will keep your tractor fit—ready for the work at all times. Proper lubrication is most important.

Use Texaco Tractoil for your tractor engine—and Texaco Thuban Compound for the *enclosed* gears, Texaco Crater Compound for *exposed* gears, and Texaco Grease for the grease cups. A Texaco product for every tractor purpose.

Buy Texaco Tractoil in 33 or 55-gallon steel drums, wooden barrels and half-barrels, or in 5-gallon sealed cans. Buy it from your nearest dealer—ask him the grade you need "B", "C" or "D".

TEXACO Motor Oil

The uniform oil that keeps your motor active. It is a fine, lasting oil that completely retains its lubricating properties despite engine heat. It so perfectly seals the clearance between piston and cylinder, that no gasoline can leak into the crankcase. Thus full compression is secured, and every last ounce of power used that the gas has to give. Be certain to get the can with the red Star and green T.

DAIRY MARKET NEWS

June Milk Prices

(From Report by U. S. Bureau of Markets)

Table I represents a comparison of the net prices received during June by producers in 3,085 local markets, for fluid milk (test 3.5%) f. o. b. local shipping point or distributor's plant.

Table 1—June Producers' Prices by Geographic Sections

Sections	Range of prices per cwt.	Comparison of average prices 1921 June	1921 May	1920 June
New England	$1.50—$4.03	$3.14	$3.19	$3.71
Middle Atlantic	1.83— 3.11	2.24	2.59	3.11

Milwaukee, Wis.	1.91	.09

The prices quoted for producers are for milk testing 3.5 per cent and delivered f. o. b. city, from which must be deducted the various transportation costs in order to get the actual price paid the producer at his railway station. In certain cities the prices given apply only to that portion which is considered as the producer's average production, the surplus being handled either by the producers' association or the dealers at somewhat lower prices. Detailed information as to the selling arrangements between producers and dealers in various markets may be secured by writing Division of Dairy Products, Bureau of Markets, Washington, D. C.

The prices given in Table II have been compiled on the comparative basis of milk testing 3.5% fat, different cities varying from 3% to 4% as the basic fat requirement on which prices are fixed. Certain markets pay on a straight price per pound fat, but most of them set a price per hundred pounds milk of a certain test and then add to or deduct from this price a certain number of cents for each one-tenth per cent in test above or below the basic test. The most usual allowance is from 3 to 5 cents for each one-tenth per cent, or "point" as usually called.

The prices paid by consumers given in Table II are for average testing milk delivered in quart bottles. It is the grade of milk most generally sold in these cities and in nearly all cases is for pasteurized milk.

To reduce the prices per hundredweight, given in these tables, to either a gallon or a quart basis, divide by 11.63 or 46.33 respectively.

Prices at Country Shipping Stations

Prices paid during June per hundred pounds for standard grade milk (Grade B, 3.5%) at the dealers' country receiving stations or at producers' railway shipping points, as also prices f. o. b. city, are given in Table III.

Table III—June Producers' Prices Per Cwt. F. O. B. City and at Country Stations

Steady to Firm Tone Reported on Cheese

(Report by U. S. Bureau of Markets)

A steady to firm feeling ruled in cheese markets during the week ending June 25, but no really active trading was reported. Prices on Wisconsin cheese boards on June 20 showed very slight advances on some styles, although sales later in the week indicated that these advances were not always followed.

One noticeable feature during the week was a more active interest in buying for storage, but this was not attended by much actual buying as the tendency to shop around for lowest prices still persists.

The weather is bound to be of more or less influence on cheese markets from now on. Hot weather defects are already noticeable in current arrivals, and will probably cause fancy cheese to hold at firm prices. Production is falling off materially in some parts of Wisconsin and if hot weather continues the shrinkage in make will run high.

The average wholesale prices on American cheese (style Twins) for the week ending June 25, 1921, and the corresponding week a year ago were as follows:

	Week ending June 25 1921	1920
	Cts.	Cts.
New York	15.7	28.1
Chicago	14.7	25.7
Boston	16.2	27.7
San Francisco	16.9	29.7
Wisconsin	13.8	25.2

The receipts of cheese at these markets were 5,246,141 lbs. as compared with 5,504,014 lbs. a year ago and 4,987,793 lbs. a week ago.

Butter Market Remains Steady

(Report by U. S. Bureau of Markets)

Butter trading during the week ending June 25 was on a quiet, steady basis, typical of a June market. Nothing much out of the ordinary transaction of business occurred. The tone was firm at the opening with an easier trend later, followed by a firmer market again at the close of the week. There was a price advance on Monday and on some of the markets again on Tuesday and Friday.

The hot weather will probably have a considerable influence on the markets as the make is expected to drop and offerings in all probability will be heavier on the undergrades and lighter on the fancy stock next week. Receipts have already shown a reduction but not enough to have much effect.

An excellent demand has existed all week for medium grades which all markets speak of as being scarce. Even poor undergrades were well taken and prices range 6c to 8c higher on these lots than was the case when the market was at its weakest point some time ago. Consumptive demand continues excellent and probably accounts for the good demand for medium and undergrades as many of the finer marks are high in price because of demand for storage. Storing of centralized in cars has been heavy but the demand is easier this week.

The report of the American Creamery Butter Manufacurers' Association covering the production of 82 plants for the week ending June 18 shows an increase of 5.3% over the output of the same week last year and an increase of 4.5% compared with the previous week. It is likely, however, that this will be the peak report as a considerable shrinkage is in prospect in many sections.

Eastern markets were all firmer on Friday and remained steady on Saturday, while Chicago regained the ½c decline registered on Friday. Receivers having butter to offer were inclined either to store or get their asking prices on stock which they control. The hot weather and continued firmness may bring some belated storage buying into the early July market.

The average wholesale prices on 92-score butter at five of the principal markets for the week ending June 25, 1921, and the corresponding week a year ago were as follows:

	Week ending June 25 1921	1920
	Cts.	Cts.
New York	34.0	58.5
Chicago	33.0	56.0
Philadelphia	34.7	59.0
Boston	35.0	59.3
San Francisco	33.5	56.5

The receipts of butter at these markets were 18,112,640 lbs. as compared with 16,676,090 lbs. a year ago and 18,737,420 lbs. a week ago.

Straw:—There was not much change in the general situation in the straw market but a few price changes were reported for the several markets where prices were quoted as follows: Wheat straw: Philadelphia $17.50, Pittsburgh $13, Cincinnati $12, Chicago $10, Minneapolis $9, Kansas City $9. Oat straw—Philadelphia $18, Pittsburgh $12.50, Cincinnati $12, Chicago $11, Minneapolis $10, Omaha $9. Rye straw—New York $23, Philadelphia $25, Pittsburgh $14.50, Cincinnati $17, Chicago $13, Minneapolis $10.50.

First Idaho Educational Scoring

Good interest was shown by the creameries of the state in the May scoring of the Idaho Educational Butter and Cheese Scoring Contest. Nine creameries competed but only two cheese factories. The quality of butter was fair, five creameries scoring above 90 and four slightly below. Let us see now who will make the greatest improvement during the summer. Honor belongs to him who, instead of being discouraged by a low score, will analyze results and be spurred on to try all the harder to convince his patrons of the necessity of better cream and gradually improve his product to the highest quality.

In most instances the cause of poor quality butter is poor cream. Why not let the patrons know about the contest? Urge them to install cooling tanks and to keep their cream as sweet as possible and success is bound to follow.

The composition score on the average indicates good workmanship on the part of the buttermaker. A little more salt in some instances would bring out the flavor to better advantage. A few samples showed mottled, due probably to insufficient working. The body of the butter was fair.

Mr. Chris Johnson, butter expert of the Western Division of Federal Dairy Extension, and H. A. Bendixen, of the University of Idaho, acted as judges. The five highest commercial scores were placed by the judges as follows: Pend d'Oreille Creamery Co., 93.; Hazelwood Co., 92.; Jerome Co-operative Creamery, 91.; Idaho Creamery Co., 90.5; and Avalon Creamery, 90.

The two cheese factories scored as follows: Wendell Co-operative Co., 89.5 and Paul Butter & Cheese Co., 89.0.

Idaho. H. A. BENDIXEN.

Of course it isn't true in your community, but in one rural section of Iowa it was found that out of 137 children examined, only 5 were up to snuff physically. Guess they hadn't had their quart of milk a day.

University of Wisconsin Ayrshire Makes a Great Record

HOARD'S DAIRYMAN:—The University of Wisconsin herd of Ayrshires has among its members two state champions and others that have either made creditable records or give promise of doing so. The first member of the herd to make a state record was University Bonshaw's Flora 37252. She still holds the state record for milk at two years. It is about her stablemate, University Cavalier's Hopeful 52265, that this article is written.

Freshening April 8, 1920, as a junior three-year-old, Hopeful was started on yearly work. During the month of May she milked 1,613 pounds of 3.16 per cent milk, which was nothing extremely remarkable. The next three months her milk yield decreased, but the test increased so that she gave better than 50 pounds of fat each month. When September came she dropped to 1,157 pounds of milk and 42 pounds of fat; which would seem more or less natural. However, when the weather became cooler she began to show the qualities that stamped her as a real producer. By December her test had mounted to 4.19 per cent and at the same time she continued to give 40 pounds of milk per day. The fat for this month was 51.51 pounds, only 2.21 pounds less than the production for June, her best month. April 11, 1921, she finished her year's work with 15,002 pounds milk and 589.41 pounds butterfat, apparently in fine shape and ready to start another year's work with a little fitting.

These records are not officially reported as yet, but regardless of a slight change she is the state champion in her class for both milk and butterfat, and also fourth place in the world for both divisions. Unless there is a report that has not been seen by the writer, there is but one Wisconsin Ayrshire cow of any age within the state that has beaten either her milk or her butterfat record.

The dam of Hopeful is University Moonstone Hope with a very creditable record of 13,583 pounds milk and 602 pounds butter. The sire of Hopeful is Cavalier's Record Prince by Bargenoch Gay Cavalier, and from the Seitz cow, Silver Pet of Spring City, the Wisconsin champion senior four-year-old. Thus it will be seen that the University cow comes rightly by her ability to produce, and by her wonderful constitution and dairy form as well. Hopeful is really a very beautiful little animal. Her udder is very good, the milk veins unusually large for a cow of her age, and her top line is good. She is just the type of cow that can go right on producing year after year. The picture in no way does her justice, because it was taken when her year's work was nearly finished. Even at that the stamp of old Bargenoch Gay Cavalier, Mr. Seitz's former great herd sire, is on her. It will be remembered that he was grand champion in both the Scottish and American shows.

Professor Hulce reports that during the year Hopeful was milked and cared for by four different short course men who were getting experience in managing dairy cattle. Perhaps if she had been cared for by one of these men for the entire year, her records might even have been increased. At any rate she finished with a great record, and everyone is waiting to see what she will do next year.

Wisconsin. B. N. PEACOCK.

UNIVERSITY CAVALIER HOPEFUL, WISCONSIN'S CHAMPION JUNIOR THREE-YEAR-OLD AYRSHIRE
OWNED BY UNIVERSITY OF WISCONSIN

H. P. DAVIS

Professor Davis has been chosen chairman of the Dairy Husbandry Department of the Nebraska College of Agriculture. He takes charge of his new position August first.

For the past two years Professor Davis has been vice-director of the Idaho Experiment Station and head of the Dairy Department. Prior to this he was with the Dairy Division.

Professor Davis is thoroughly prepared to discharge the duties of his new position, and he has our best wishes for success.

Wisconsin Ayrshires Breeders Meet

Mr. Stephen Bull's Aldebaran Farms at Racine, Wis., furnished an ideal setting for the Wisconsin Ayrshire breeders' annual meeting on June 25 as the 70 or more Ayrshire breeders, their families, and friends who were present will testify.

Those who arrived at all early spent their time before lunch to good advantage inspecting the herd—one of the best in the middle west.

Following an excellent luncheon, the meeting was called to take care of the usual routine, business, elect officers, etc. Officers elected are: President, B. B Simmons; vice-president, Adam Seitz; secretary-treasurer, Wm. Nisbet; executive committee: Stephen Bull, E. Tschudy, I. Jones.

Mr. Bull, the retiring secretary, brought out one fact not entirely complimentary to some of the Ayrshire breeders of the state. Although many new members have joined the association during the past year, about forty of the sixty-four older members failed to renew their memberships, which would apparently indicate a lack of progressiveness where it is most needed.

Following the business meeting, Mr. H. W. Gossard, of Illinois, one of the largest Ayrshire breeders of the country, made a splendid talk, giving the Wisconsin breeders some advice that could profitably be followed. He urged them to talk Ayrshires more, but to talk to some one else rather than among themselves. Sell the other fellow and get him started selling the Ayrshire idea. The Ayrshire cow is a good one and if every breeder would do as much to advance her cause as does the cow herself, Wisconsin Ayrshires would soon be away ahead of their present position.

F. R. Steel, general manager of the Gossard Breeding Estates, urged that more local work be done among calf club members and the like, and advised the state association to direct its advertising more towards farmers and dairymen than toward established breeders.

Following the program was the drawing for the registered bull calf donated by Mr. Bull, and for which each guest had registered. Mr. E. Roth held the lucky number.

New York Dairy Notes

HOARD'S DAIRYMAN:—The Tompkins County farm agent and two dairy experts from Cornell were called to West Danby by dairymen delivering milk there, to inspect the milk plant in order to determine why their bacteria count was so high. Friction had arisen between the farmers and the buyer, as the latter's bacteria count did not look fair to the farmers who sold their milk at a price based on the count.

Examination of the plant showed lax management which had been causing much of the trouble. Much of the equipment was found to be in unsatisfactory shape. The college men took samples from 81 different lots of milk, finding the test averaging about 100,000 or less. The company purchasing the milk had been reporting tests running as high, when tested at their New Jersey plant, as 30,000,000.

The college was recently called to a town on the northern boundary to settle a similar difficulty for the farmers who are learning what a wonderful help and support to them the college can be and is.

⚜

Plans are being made for the huge 12-ton cheese to be made at Lowville for display at the New York state fair. The start of its manufacture will be made a considerable ceremony with Lieutenant-Governor Wood, Commissioners Henry K. Williams and George E. Hogue participating. The cheese will be the biggest one ever made and will be the star feature of the dairy exhibit.

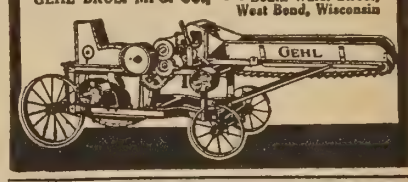
⚜

J. D. Brew of the dairy department at Cornell is touring some counties of the state conducting an educational campaign in which dairymen are shown how to keep the bacteria count of milk down to a low level. He is testing the milk handled at the various milk stations to determine the bacteria content of the liquid. He has done much to teach users of milking machines how to care for the machines so as to produce milk of utmost cleanliness.

⚜

At a recent meeting of the board of directors of the New York State Holstein Cattle Breeders' Association it was decided to protest the increase in cattle freight rates. In April the railroads shifted cattle from the fifth to the fourth class increasing the rate about 20%. Mr. E. R. Zimmer is to confer with the railroad officials relative to re-establishing the old rates.

An extensive sale policy was also decided upon, with a two-day sale October 5 and 6 at Endicott. It will be the first semi-annual sale of the association. Entries of animals will be limited to 150 to be consigned by members. Quotas will be assigned each county on the basis of membership and number of cows, insuring just representation from each county.



The matter of a sale next January at the annual meeting was discussed and a committee named to investigate Utica as a possible place. The matter of sending pure-bred Holsteins to France for restoration of devastated regions was discussed.

HOARDS DAIRYMAN JUNIORS

A DEPARTMENT FOR THE DAIRY FARM BOY

The Race Through the Corn Field

[Continued]

"Don't blame me if dad raises a rough house about your trying to be a lawyer," said Jerry, half jubilantly at the prospect of the impending trouble which he considered Jimmy had drawn himself into, as the two were unhitching their steaming horses in the barnyard lot.

"You're not man enough to assume any blame," retorted Jimmy hotly. "I'll take the law into my own hands and you'll see that I'll win the case, too," he boasted.

"Well, you were beaten in one race, anyway, wasn't he, Pete?" Jerry snickered, "and I guess you and me had better keep out of this. Dad'll give him all the race he's looking for this time," and he eyed his brother curiously, wondering how he could be so bold in the face of the apparent wrath which he thought he saw written on the weather beaten face of his father. "He'll probably find out that he'll need other lawyers besides himself," he continued to tantalize in semi-audible tones.

"Lot of fuss I've stirred up," Jimmy began again, "just because I've got my own life to live and because I've decided to live it in a certain way. It's my own business," he said with determination," and I'd like to see any one argue me out on the proposition." He was growing defiant at the thought of having his ambitions curbed. "What's the use in living if a fellow can't do some of the things he wants to," he added indignantly.

But Jimmy was a born diplomat. He would place all of his cards in the open at any cost and he planned on doing the same this time. So it was with his usual optimism that he took his place at the family dinner table with his nine brothers and sisters. An unusual silence prevailed and most of the younger Greenes were casting sly, timid glances toward the head of the table. They had scented the trouble and with Jerry they were waiting for it to begin.

But it didn't begin as soon as they had anticipated. The meal continued in silence excepting for the smacking lips and gulping noises made by the younger members as they greedily devoured the substantial food that kept them in good health. Finally they turned their attention in Jimmy's direction, but he, like his father, did not deign to notice them, until at last little Tommy who by this time had quite completely satisfied his hunger, innocently remarked: "What's the trouble, Jimmy? Jerry can't beat you every time in the race." Tommy had heard the argument in the barnyard lot while the boys were unhitching their horses and so, childlike, he felt that he knew what it was all about. At the mention of the race several of the others snickered outright for they were beginning to look upon Jimmy as out of their class now that he was going to college. "I should think that he could have won against old Pete with them two colts," sister Jenny chimed in. "They were raised according to college instructions given by Jim himself," she added sarcastically, "which goes to prove that all them professors say isn't so true after all," was her final comment.

And even this taunt failed to bear the looked for fruit. Jimmy remained stolidly silent but for the look of amusement that covered his ruddy sun-burned face, and the smile which he gave to little Tommy as the latter slipped from his chair and started toward him, a habit which he had developed at the time he had learned to walk. He was very fond of his big brother and never quite so happy as when he could be with him. The fondness evidenced by the oldest and youngest of the family for each other always brought to the homely face of mother Greene a smile of satisfied contentment which now, as was her custom, she poured in the direction of her husband.

Apparently this was too much for him. He realized that he was expected to say something and he bit savagely into the full loaf slice of bread that at that moment he had hoisted to his mouth. And between chews he managed to sputter, "Jim, is this fool idea true that Jerry said or was he only fooling?"

EVEN IF THE CORN FIELD IS FREE FROM WEEDS, IT MAY BE A GOOD PLAN TO CULTIVATE IN ORDER TO BREAK UP A SURFACE CRUST ON THE SOIL

At the mention of his name, Jimmy quickly looked up while the faintest glow of embarrassment left its red in the full of each cheek. He was the picture of health for the influence of the three weeks' outside was beginning to put him back into hardened physical condition. With his characteristic toss of the head, he shot back, "Sure it is! You didn't think that I was fooling about a matter as serious as this is, did you?"

"Well, it's what I would call a mighty shabby trick on your family," was his father's first comment, and he glowered fiercely at his son. "Here we've all been banking on you coming home and taking hold like you should do. By the time you are through your mother and I will be ready to take a rest and here you are upsetting everything with this fool notion you've got into your head. I think that we deserve more consideration than this, and then, here's Jerry, too, who has been bearing the big load for the past two years and doing it cheerfully, too, because he was so anxious to have you get your education and then come home to form the partnership that you had agreed to do with him. It's all wrong and, besides, where did you get that idea from? Who told you that you would be a success in the law business? We've got enough of them fellows as it is and if they'd go to work in a real honest way, the world would be better off. Look at that Lawyer Jackson down town. I'll bet he's a sitting round doing nothing right now waiting for a little business to come his way. I want to tell you, son, that them professions don't give you a living so all fired easy as you think they do. You've got to get right down and scratch!"

That statement gave Jimmy his opening. "That's what you've got to do in anything if you want to make a success," was his first rebuttal. "You've worked hard all your life, dad, and you've been successful, too, at least you own your farm and you've raised a large family of us. I call that success and if I'm any judge, you certainly have scratched as you call it. So I don't see that there is very much to your argument."

"Yes and a fine family, I would say, "interjected the mother proudly. "Patrick, they are a splendid lot," and she reviewed her offspring with more than customary egotism. "Jimmy would make a great lawyer, Patrick, and perhaps we should allow him to decide that for himself, and seein' how Jerry here will surely be a farmer, maybe it would be best to have at least one lawyer among them," she explained in almost childlike simplicity.

"There's nothing more to decide, ma," Jimmy chimed in again. "That's already been done and I suppose that's what this fuss is all about. It doesn't make any difference what any of you say. The whole matter has been threshed out after careful consideration for every one concerned and it's settled, ma, there'll be one lawyer in the Greene family. It needn't make one atom of difference to your plans, dad. Jerry will study agriculture and he'll make a capital, up-to-date farmer. He and Bob will just turn things upside down in this community."

"I'm surprised that Bob hain't changed his mind, too," broke in Mrs. Greene a second time "and I'm just thinking that Mrs. Ramsay will be just a little jealous when you graduate from the law college, Jim, and her son only gets a diploma from the agricultural college," and she sat back in her chair quite puffed up, showering nods of approval upon her eldest.

"I like your attitude, ma," Jimmy approved in return. "But you don't want to think for a minute that law is any better than farming and, as dad said awhile back, you've got to scratch to make good in that profession, but I'm willing to do that. No, it isn't because I think that it will be easy for me to become a good lawyer that made me make the change. It's because I feel that I am fitted for that work and that I can be more successful in it than I can on the farm. And as for Bob, ma," he continued, "he gets more splendid every day. He's the solid chap he was and he's stronger for the farm today than he ever was and so you needn't look for him to follow my example. I told him that some day he would be the federal secretary of agriculture and that perhaps I might get to be a senator if I could keep pace with him."

"Well, you're not going to get to be a cheap lawyer on any of my money," broke in the father again, with a roar. If you change your course, young man, you'll do it on what money you can make. I'm not going to spend hard earned cash for that kind of foolishness. First thing you'll be out of that into something else!"

But this didn't serve to dampen Jimmy's youthful ardor in the least. "It hasn't cost you very much yet, dad, and I can at least thank the agricultural college for the work they gave me to do to earn some money. That's the only way that I was able to stay in school. You did give me a check once, though, for one hundred dollars and that's all the help I have had in these two years so you needn't figure that any threat like that will stop me from carrying out my present plans. I'll just continue to work my way through and, of course," he slyly added as he winked at his mother, "if you ever feel that you are making more than you are entitled to on this farm yours truly can help to spend some of it in the law school."

Jerry had had time up to now to consider the entire situation, and boylike he began to feel the pangs of remorse for his brother. "Let him have his way, dad," was his first comment. "He's getting to be quite a lawyer already and I think he'll beat you in the race, but," and here he turned squarely to meet Jimmy's smile, "you can't beat me in the farm race when old Pete's on my side! None of your college ideas 'round him. I really didn't know how good the old fellow still is, dad," he chuckled, "'til I tried him out this morning. Sure, dad, let him have his way," he coaxed. "He's always had and he might as well this time. You and I will form the partnership, just like Bob and his dad will do. I'll not go back on you and I'll swear that I'll take the responsibility off your shoulders and that will be just as good as moving to town. You can take things as easy as you want to and then when one of the other kids gets grown up you can drop out of the partnership if you like. Jimmy thinks that he's so smart, let's give him the chance to hang himself or see what he can do. But we ought to have it understood that if he makes a failure out of law, he can't come butting into our business, and he should also know that we will conduct our business so successfully and peaceably that he won't be able to collect any fees from us."

The latter statement brought a faint smile to the father's face, and he replied by saying: "That's what

I've made up my mind to. If he can make a go out of the law, that's his business, but if he starves to death on it, that'll be his business, too. But I hope for your sake, Jim, you'll make good and if it will please your mother so much to have you a lawyer, I also hope that she will not have to be disappointed. What we want is either a big lawyer or none at all.

"You've got the idea, dad," Jerry grinned at his brother, "and say, dad, I think that this partnership business of ours ought to be formed right away, now that Jimmy is out of it. Let's see how bad we can make him feel," he added as the two left the house together. When at a safe distance, he suggested, "Say, dad, I've got a new idea. I'm not going to spend four years down there at college. I'd like the education all right, but now that we have had to change our plans some, I think it is up to me to change mine, and this is what I have decided to do. I'll just take the fifteen weeks' short course in agriculture. That comes at a time when there isn't so much work to do and then it only lasts two winters. Hank Brown, you know him, the fellow that finished a year ago, says that he got a good deal of practical stuff from that course. What do you think of the idea?"

"The idea's good, Jerry, but I'd like to see you get as much schooling as Jim."

"Don't you worry about that, dad, one smart one in the family is enough and I guess ma thinks that Jimmy is the one to educate, any way."

"Well, for the time being, son, we'll plan on this then, and when the fall work is done, you go and take your fifteen weeks' of the short course and between me and the other boys I guess the chores will be taken care of. And about the partnership business, we'll talk that over after your mother and I have settled what will be the best way to work the thing out."

"I'll bet Jimmy thinks you've got it in for him now," Jerry smiled, "and I guess you were pretty hot at us both for racing the horses the way we did, eh, dad?"

"Oh, I don't suppose any harm was done," he returned, "and maybe it did Jim some good to know that he can't win out on every thing he tries to do. That old Pete is good yet, son, and with the same care he's always had on this farm, I wouldn't be surprised to see him in the harness for another ten years. Wonder what the lawyer is doing," he said just a bit sarcastically, as he drew forth his watch, adding, "it is time to get back to the corn."

Every year should see some concrete work added to your farm. Every bit of concrete work means the end of so much depreciation and repairs. Use Lehigh Cement, sold by reliable dealers. There's one near you—under the big blue and white Lehigh sign.

LEHIGH CEMENT

ON THE WIGMAN FARM AT HOLT, MICH. TWO SURATO BOYS AND THEIR PRIZE GUERNSEYS

Fruitland, Idaho, Jersey Calf Club

Is thirteen unlucky? This goes to prove that it is not. There are thirteen very enthusiastic embryonic Jersey breeders comprising the Fruitland Registered Jersey Calf Club. They were organized last fall largely through the efforts of Miss Scribner, county club agent, and Frank M. Gardner, cashier of the Fruitland State Bank, Fruitland, Idaho.

Mr. Gardner's bank financed the purchase of the greater portion of the 112 registered Jerseys at the co-operative sales held in May and December, 1920, and offered to loan money to the members of the calf club for the purchase of registered Jersey heifers. Mr. Gardner is an enthusiastic booster for Jerseys and has been of great service to the breed by his support and service.

The local leader, Ralph Makinson, a Jersey breeder is assisting the members in their problems and directing their studies. The advisory board consists of Frank M. Gardner, banker; Geo. Eldridge, Jersey breeder (owner of Adelaide Sultan 123005); and L. P. Dorothy, Jersey breeder (herd on semi-official test).

This club is particularly fortunate in having received from the Meridale Farms, being one of the three calf clubs in the United States to be awarded this honor, a gift of a bull of splendid conformation and backed up by excellent records. This bull is Oxford's Sayda's Heir, whose dam, Oxford Carteret, produced 613 pounds butter class AA in 347 days as a three-year-old. This bull is claimed to be the oldest living R. of M. sire, being 19 years old. To say that the calf club members are proud of this bull is putting it very mildly and they have each written a personal letter expressing their gratitude to their benefactors.

The writer recently attended one of their meetings and can truthfully say it is doubtful if any club in the world has a membership of brighter, more interested, and businesslike members. This club is a credit to the Jersey breed, to Payette County, and to Idaho. The greatest need is for more like it.

F. R. CAMMACK.

Junior Letters

Hoard's Dairyman Juniors:—I have a grade Jersey heifer which I bought of my father for $15. He said she was worth more but he let me have her cheaper. She will be six months old the second of May. I named her Betsy. She weighed 210 lbs. when she was five months old. She gets silage and one-half pound of ground oats and barley mixed with a little oil meal and about 14 pounds of skim-milk a day, all the timothy and clover hay she wants, all the water she wants, and salt. I made her a rope halter. She leads fairly well. I am raising her for the boys' and girls' club we have in our town.

We have 54 spring pigs and two more sows to farrow. We have now 9 calves including my calf. We are milking 24 cows. We sold all our red cows but one.

I must close wishing all kinds of good luck to the juniors.

Minnesota. Stanley Hillier.

Hoard's Dairyman Juniors:—I live on bank of the Mohawk River. I am 12 years old and in the 5th grade at school. There are only sixteen pupils in our school. Our teacher's name is Mrs. Hulett who lives in Scotia.

We have 13 cows, 1 bull, 3 heifers, and 3 calves we are raising. Our cows have all been fresh. We have four horses. We are planting our corn this week. We have planted about ten acres of oats and about ten of corn.

I will close wishing the juniors good luck and hope some of them will write to me. My address is Pattersonville, N. Y.

Roger M. Wilcox.

Lightning Rods—Exclusive agency and quick sales to live dealers selling "Diddie-Blitzen Rods." Our copper tests 99.96 per cent pure. Write for agency. Prices are right. L. A. DIDDIE CO., Marshfield, Wis. 9*

SALESMAN WANTED

Wanted—Young men with experience in animal husbandry, who have sufficient experience in dairying to judge relative value of dairy rations. To such men a proposition to sell a manufactured dairy ration to dairymen through dealers is offered. Only men who are able, through experience, to convince themselves of the value of the feed through actual experiment are desired as our product has merit and we wish to sell it only by being able to show actual results. Applicants should state age, whether married or single, education, practical experience so that we may be able to act quickly. Our proposition will be submitted promptly to those of ability. Address BOX 800, care Hoard's Dairyman. 25-3

PRINTING

Hoard's Dairyman Art Department designs your letter head free. Just tell us your breeds of stock. Book of 5,000 Farm, Ranch and Cottage names 25 cents. Ask for samples of letter heads, envelopes, shipping tags, cards, milk tickets, etc. Poor stationery is more of a damage than a help. Be sure and give correct post office address, including state. Address HOARD'S DAIRYMAN, Art Dept., Fort Atkinson, Wisconsin. 8-tf

First-class dairy farmer wants to operate fully equipped farm and dairy business on permanent money making arrangement. Address BOX 807, care Hoard's Dairyman.

Oregon Holstein Club Picnic

The breeders of the Oregon, Wisconsin, Holstein-Friesian Club gave their first annual community picnic on the farm of Arthur Sholts on June 17th. The Oregon Club is a local unit of the Dane County Association, and was organized last February. The growth of the club has been very rapid and it is a promising organization.

The business men of Oregon closed their places of business for the afternoon and a large number went out to the picnic to acquaint themselves with what the Holstein men in their locality were doing. A ball game was staged between the farmers and the business men, and this proved to be quite an attraction.

Wisconsin. R. H. SCHUSTER.

Ohio Guernsey Meeting and Sale

The annual meeting of the Ohio Guernsey Breeders' Association was held June 6 on the grounds of the Ohio State University. The large attendance marked this gathering as one of the best in the history of the organization. The many important achievements of the association during the past year met with the approval and increased support of Ohio Guernsey breeders. The work of Field Secretary James E. Harper was commended. Reports of the officers for the past year were approved. President C. Davis was re-elected for another year. Other officers for 1921-22 were elected as follows: N. H. Hill, vice-president; Fred W. Floding, treasurer; directors, W. E. Wright, C. M. McConnell, and Emmett Steiner.

A banquet was held Monday evening at which President Davis acted as toastmaster. He introduced Mr. Harper who spoke on the activities of the organization, calling particular attention to the value of the monthly Guernsey News Bulletin. Karl B. Musser, field representative of the American Guernsey Cattle Club, was the next speaker. Mr. Musser told in a very pleasing way of the national Guernsey outlook and called the attention of the Ohio breeders to the prominent place which the association holds because of the many progressive steps originating through its efforts. Mr. Musser was followed by Dr. R. R. Laughlin who has done some exceptional practical and scientific work in the treatment of sterility and abortion. Dr. Laughlin discussed his work in a manner which was beneficial to all and gave a talk indicating that careful investigation will probably result in the ultimate discovery of methods by which breeders will be able to better control the losses caused by either of these conditions. Several other speakers informally discussed problems of interest to the Ohio breeders.

The second annual sale of the Ohio Guernsey Breeders' Association was held at the State Fair Grounds on June 7 and was a marked success. The 1921 offering took the form of a guaranteed consignment sale in which every animal was guaranteed a breeder and sold under the privilege of a 60-day tuberculin retest.

Forty-one heifers and eight bulls averaging 14 months of age were sold for an average of $170. This price is not in the least spectacular but highly satisfactory considering the age of the animals and present day business conditions. The cattle were well fitted and in excellent condition and gave new breeders an opportunity to purchase foundation animals of real merit.

Golden Secret's Robin, a daughter of Langwater Golden Secret, topped the sale at $360. She was consigned by E. C. Peck and purchased by Fred W. Floding. Sweet Springs had the highest average for a consignment of three heifers which brought an average price of $255. Circle W. Farm bought Langwater Madge for $250. Madge was consigned by John Itschi and is out of a half sister to Katherine's Trixie, former leader in Class F. Twin heifers of remarkable individuality consigned by J. S. Yoder were purchased at the end of a lively bidding contest by L. G. Neely of St. Marys, Ohio.

Waupaca Guernsey Picnic

The annual picnic of Waupaca County, Wisconsin, at the home of W. H. Taggart & Sons June 16 was attended by over 400 Guernsey enthusiasts. James H. Murphy, Manager of the Tilden Farms, Wisconsin, was the chief speaker of the day. His subject was The Guernsey Cow and Hard Times. He brought a very optimistc and encouraging message to his audience. T. H. Campion of the Wisconsin College of Agriculture spoke on Community Breed Clubs which is a subject of great importance in large counties where it is hard for a single county organization to keep in intimate touch with all the breeders. Dr. Healy who has charge of federal tuberculin testing in Wisconsin and Dr. Eliason, state veterinarian, were both present to compliment the Guernsey Breeders of Waupaca County on their active interest in tuberculosis eradication. They emphasized the fact that Waupaca County has more herds under federal supervision than any other in Wisconsin. A. O. Collentine, Dairy Extension Specialist of the Wisconsin College of Agriculture, had charge of the judging contest.

Col. J. R. Love sold the registered bull calves selected for the sale in connection with the picnic.

Wisconsin. JAMES H. DANCE.

Among sad facts the tongue can state
One sad one is, "He's underweight."
And that is why we sing and say,
"Give kids a quart of milk a day."

CARTER WHITE LEAD is concentrated white paint. To make a gallon of the *best* and *whitest* outside paint you can buy, thin 12½ lbs. of Carter White Lead with ⅔ gal. of linseed oil. Nothing could be simpler, nothing is more economical.

CARTER WHITE LEAD is the favorite paint for white houses because it is so white itself. CARTER whiteness is *natural*— not artificial. Nothing is added to make it whiter; it is not bleached nor blued. There is nothing in any package of white lead branded "CARTER" except pure white lead and pure linseed oil.

Lead and oil paint can be tinted any color. You can buy CARTER WHITE LEAD, linseed oil, and tinting colors nearly everywhere paint is sold at retail and the dealer will help you to figure out how much paint you will require, what tinting colors will be needed to produce the shade you select and what it will all cost at present market prices. You will find it to be so reasonable that you will not be disposed to postpone longer any needed painting.

Cotton and Cows in Salt River Valley

(Continued from page 957)

ing fields, good management, and economic marketing."

The Phoenix Chamber of Commerce, which numbers among its members some of the most prominent farmers of the county, including Mr. Fred Tait, president of the county farm bureau, has an active committee working on the matter of reorganizing the dairy industry. This committee recently compiled the following data relative to the general situation:

"In 1914 there were under the Salt River Valley project 86,930 acres of alfalfa which were cut for hay and 11,360 acres used for pasturage. There were 9,550 acres of cotton and 24,202 head of dairy cattle, worth an average of $67 a head. Milk brought an average of 32½ cents a pound for butterfat at the farmer's gate. The following year milk prices dropped to 29 cents, cotton acreage dropped to less than 2,000 acres, alfalfa for hay remained about the same and the acreage of pasture just about doubled and the number of cows increased to 31,360, worth an average of $83 each.

"The number of cows steadily increased to more than 50,000 head in 1917, worth $79 each, and the average for milk was 52 cents. Alfalfa pasture increased to 53,000 acres, but the acreage of alfalfa for hay dropped to about 68,000, and cotton jumped to 23,444. In the month of September of that year the creameries of the valley paid the farmers for butterfat in milk and butter $172,375. This was independent of the revenue of dairymen who made butter or retailed milk and also independent of the several cheese factories that then made cheese. The production of butterfat for 1916 and 1917 has been estimated to have been about three and a half million pounds each year. These were the banner dairy years.

"In 1918 the acreage of cotton has increased to 50,000 acres, alfalfa for hay had dropped to 63,000 acres, and alfalfa pasture dropped back to 44,000. Dairy cattle decreased to 36,800, worth $56 a head. Butterfat in sweet milk was worth 62 cents, but cotton looked like easy money and lots of it, and by 1920 the acreage of this crop had increased to 142,000. Dairy cattle had dwindled in numbers to 11,246. Less than 4,000 acres of alfalfa pasture remained and the acreage of alfalfa for hay was only slightly over 25,000 acres. The average price of milk paid to farmers for butterfat in sweet milk was 80 cents."

This season the amount of alfalfa hay and other forage will be greater than can be consumed unless more live stock is brought in to consume it. The county agent, Phoenix Chamber of Commerce, and the state experiment station will all co-operate with the farmers to aid them in getting the best of cows.

Farmers are being urged to organize co-operative associations. Prof. R. N. Davis, Dairy Extension Specialist on this subject, says: "Because of the present condition of the dairy industry in Arizona there is possibly not a state in the Union in which it is possible for co-operation to be of as much value to the dairy industry as that of Arizona. Because of the exodus of dairy cattle from the state, dairying is now in its infancy in this state. Dairying will again be the principal agricultural industry in the state if re-established on a sane basis. The quality of the average cow which was being milked in the Salt River Valley possibly contributed more to the downfall of the industry than any other factor. If dairying is to be a complete success in any section, only

World's Greatest White Collies

They will herd your stock, guard your flock and rid your place of vermin. A playmate for the children and a household companion. Largest breeders of white collies in the world.

SHOMONT KENNELS
Thos. Shover, Prop,
Dept. D, Monticello, Iowa

good, high producing healthy cows can be used. These cows can best be secured by co-operation among the dairymen, by purchasing their cows co-operatively from the dairy sections of the country. Small dairymen and those just beginners in the dairy business frequently find the best sires apparently too expensive. As a result such breeders must either be satisfied with mediocre sires, pay a heavy service fee for a good one, or co-operate in purchasing a sire.

"By organization and co-operation the dairymen may re-establish the dairy industry in the Salt River Valley on a permanent basis and they will then have their association ready to organize cow testing associations and co-operative marketing associations and will be in position to purchase feed and other supplies co-operatively."

A co-operative marketing law modeled after the California law was recently passed in the Arizona legislature and may be of some help to dairymen in organizing.

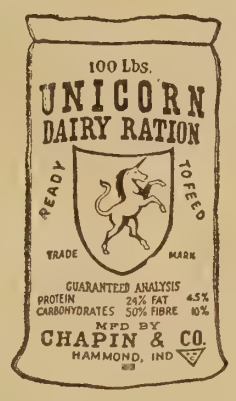
State Dairy Commissioner Clarence Dana is thoroughly in sympathy with the dairymen and will work with all phases for the improvement of conditions and the betterment of the industry. In his annual report he says:

"I can see before this office a task in assisting the farmer in getting a better grade of cows and to maintain them under better sanitary conditions than that of the past, and to educate him in the proper mixing of feeds, that a larger production of clean, pure milk may be had and produced from less acreage and fewer cows. Realizing this is a large undertaking I have solicited and will receive the the hearty support and co-operation of the state university, the county extension workers, the health officers, and the dairymen themselves. The problems of the dairymen will be taken up collectively and individually, as presented. Markets will be sought so as to assist in getting the best cows in the lowest figures. Bulletins will be issued, lectures given, and any other assistance individually or otherwise, that this office can offer with the limited means and help at hand, will be given. A campaign will be made in the way of educating the general public relative to the value of milk as a food, especially in the homes where there are growing children."

Although the number of dairy cows is now about the same as in 1910, the industry as a whole is on a considerably more substantial basis. At that time very few farmers had stables, milking in open corrals. There were no silos and very few herds of registered cattle. Today there are many farms well equipped with stables, milk houses and silos, although a considerable number of these are not used as dairy farms at present.

There are several herds and a good many individuals of high class registered dairy cattle. Henry Renand, the veteran breeder of the Valley, has maintained his herd throughout the cotton "craze". Other dairymen have kept their herds, and planted cotton as a money crop. It is noticeable that these dairymen are not worried at all about the price of cotton. They have a few bales stored away. The cows paid for making the crop and they don't owe the banks or anyone else. When the time comes to sell, the cotton will be "velvet", as it should be; and in the meantime, why worry?

Future farming is bound to be modeled somewhat after the plan that has proved successful with these dairymen who have stuck to the game and raised a little cotton on the side as a money crop. With all interests working for better cows, better methods, and better markets, together with the beginning of the rejuvenation, already off to a good start, the dairyman's outlook in the Salt River Valley is rosy although the horizon of the general farmer is somewhat clouded.



Large Profits From Liberal Feeding

Most dairymen feed their cows well in the winter time.

There are more cows underfed during the summer than at any other time—underfed both on grain and roughage.

Dry pastures, hot days and fly-time—all call for common-sense feeding.

Profitable feeding consists in feeding your cows to their full capacity—with the right kind of feed.

Write for our free booklets:

1. Cow Testers' Manual.
2. Feeding and Fitting Methods.
3. Calf Raising Manual.
4. Swine Breeders' Manual.

With Unicorn as the base of your summer ration you will get maximum production—more milk for more days.

Feed Unicorn *NOW*. Grain fed now will bring big returns next winter; both in extra milk and saving of feed, due to the better condition of your cows.

Remember, too, that summer grain is the cheapest grain.

True economy is in keeping your cows in good physical condition at all times. Do not allow them to become "run-down" while on dry pastures.

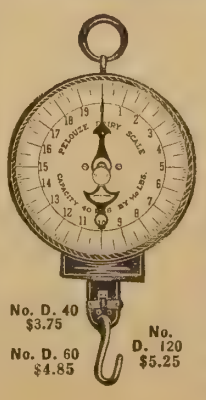
Pennsylvania Cows Worth $67,000,000



HOARD'S DAIRYMAN:—Pennsylvania live stock was valued at $174,000,000 on January 1, according to the bureau of statistics of the state department of agriculture. Milk cows, whose total value was estimated at more than $67,000,000, form the backbone of the farming industry of the states. Horses come second with a valuation of $55,141,507.

Women Form Pig Raising Club

Augustaville, a farming hamlet in Northumberland County, Pennsylvania, claims the honor of having the state's first women's pig club. Berkshires will be bred, and twenty women have purchased pigs. J. M. Fry, county agent, officially weighed twenty pairs of these pigs. At butchering time the high scoring porker will be given a blue ribbon. Mrs. Ira Penn is president of the club and Mrs. H. N. Wilkinson, secretary.

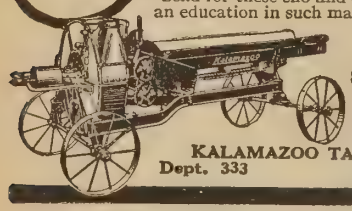
SAFETY

Cuts More and Better Ensilage with Less Labor

The Rowell has greater capacity and cuts better ensilage with *less labor*. The apron travels the entire length of the machine and moves its load up to full contact with the cutting roll—the fodder is not pulled over boards or steel plates. If the bundles overlap, the auxiliary roller tramps the fodder into position for the cutting knives.

ROWELL
SAFETY-AUTOMATIC

The Safest Silo Filler—Cylinder type. All moving parts carefully guarded. Shoulder guard keeps fingers from getting to knives. The automatic release allows cutting cylinder to stop *instantly* if bits of iron or stone get into the machine. Reverse lever operates under any load or at any speed without stripping gears. The powerful fan blows ensilage to any height silo.



Send us the size and height of your silo and the power you have, and we will quote you on the Rowell you need. Own your own Rowell and be ready when the corn calls.

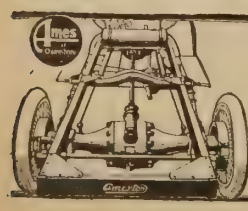
PAPEC
SILAGE CUTTER

At a Much Lower Price



A PAPEC for *less money* than almost any cutter made! It's a fact—and all because Papec is *best-liked* and *biggest-selling*. This means *big production—low manufacturing cost* to us, *low buying price* to you. Then, from our *already lower price*, we made a big cut with utter disregard of what we paid for 1921 material. This gives you *right now* a price you can pay. You know there is *only one* Papec—the one you've seen advertised nationally for years—the one on which we give you full protection with this wonderful guarantee:

"We guarantee any Papec Cutter to throw and blow ensilage perpendicularly to the height of any silo, with any power, provided the speed of the cutting wheel does not fall below 600 r. p. m. We also guarantee that any Papec Cutter will cut and elevate more ensilage with the same power than any other blower cutter."

Send for catalog today—no obligation

Tell us what power you have, size of silo, etc. Ask for prices f. o. b. nearest of our 36 distributing houses.

Papec Machine Co. 116 Main St. Shortsville, N. Y.

Turn Your Old Car Into a Money-Making Motor Truck With an *Ameshilt*

Worm Drive Truck Unit

At from 1-5 to 1-3 the cost of any truck of equal capacity, the Ford, Buick, Dodge, Cadillac, Reo, Oakland, Chalmers or Maxwell, or any other make car with transmission amidship can be made into a Guaranteed Worm Drive 1 1-2 or 2 ton truck with an Ameshilt Worm Drive Truck unit. Not a slow, cumbersome makeshift, but a complete motor truck assembly. Save the engine, front axle and side members of your old car—sell the rest. Then bolt on the Ameshilt Truck Unit frame and you have a sturdy, dependable, money-making truck. Worm drive, as used in all best motor trucks. Bears the famous "Ames of Owensboro" absolute guarantee. Saves money and makes money for you. Write for literature and prices.

THE F. A. AMES CO., Incorporated 751 Main Street, Owensboro, Ky.

Jersey Jubilee in Payette, Idaho

HOARD'S DAIRYMAN:—Although the breeding of pure-bred Jersey cattle is only in its infancy it is rapidly assuming an important place among the industries of the Payette Valley, Idaho. The county now has two hundred head of pure-bred Jersey cattle, one hundred of which were shipped in during the past year, and the interest is daily increasing.

During the recent nation-wide Jersey jubilee, the Idaho state association of Jersey breeders spent one day inspecting herds in the Payette Valley. Three hundred people participated, many of them from outlying counties. The expedition, consisting of some thirty cows, visited the herds of J. H. Joiner, E. P. Dorathy, C. H. Sargent, Arthur Elridge, and F. C. Conantson. Mr. Conantson numbers among his splendid herd a beautiful heifer, Bonnie Rochette, valued at $1,000. On the Sam High place the most notable animal was the association bull, "Count", of which Mr. High is the caretaker.

After the inspection of the herds, a meeting of the association was held and directors for the coming year were elected as follows: For Payette County, C. H. Sargent; for Canyon County, L. S. Dille; for Washington County, Bert Pease; for Ada County, G. E. Gearheart; and directors at large, G. S. Haynes of Ada County. As soon as Twin Falls Co. is admitted into the association she will elect her own representative to the board.

The association went on record as favoring the union of Idaho with Washington, Oregon, Utah, and California in the matter of engaging the services of a Jersey specialist. The directors met immediately after the general meeting and re-elected C. H. Sargent president, G. E. Gearheart, vice-president; and Bert Pease secretary and treasurer.

During the noon hour the women of the Fruitland Farm Bureau served a free dinner to all, after which an interesting program was enjoyed. Professor F. R. Cammack introduced the speaker of the day, C. Y. Cannon, Professor of Animal Husbandry of the Brigham University of Utah. The matter on which Mr. Cannon laid most stress was the testing of cows. "If your cow is worth breeding and keeping," said the speaker, "surely you want to have the proof of her excellence in black and white." Mr. Cannon declared that the proper testing of cows is the only way to bring the herds up to a high standard, and to maintain it. The speaker was followed in turn by C. H. Sargent, G. S. Haynes, Arthur Elridge, E. P. Dorathy, Bert Pease, Mr. Rush of the State Cow Testing Association, and Miss Ina Scrivener, Payette County Boys' and Girls' Club Leader.

To one who, ten years ago, knew the Payette Valley farmer and his few scrub cows, these wonderful herds that are to be seen today are splendid tribute to what has already been accomplished and a brilliant promise of what may yet be done, as the industry is still in its infancy.

The boys and girls of the farms are doing no small part for they are entering with enthusiasm and trained knowledge into the work of improving the live stock of Idaho. That this has not escaped the notice of those in authority is proved by the fact that while all other state fair premiums have been reduced from 25 to a 100 per cent, the junior fair premiums have in every case been increased.

That the parents of the youngsters are enthusiastic over the junior club movement is very evident. At the Jersey Jubilee in Payette County one might hear mothers bragging of the excellence of the calf weaned by her boy or girl, of the prizes it has won, or is going to win at the state fair. Idaho has the largest junior calf club enrollment in the West. And the seniors are right in line with the juniors. Of the fourteen gold medal bulls in the United States, eight are in the West, six in Oregon, one in Washington, and one in Idaho. Next year Idaho does not propose to be so far behind the gold medal line. More and more are the men of Idaho realizing what pure blooded stock is going to mean to the breeders of dairy cows.

Idaho. (MRS.) P. H. BROWN.

Lincoln Co., Mo., Boosts Jerseys

Several of the leading farmers in Lincoln County, Missouri, being interested in encouraging the people to start in the dairy business, came to their county agent, E. L. Peter, to help them start something. Since the calf club movement is getting so contagious they naturally turned their attention to a calf club. This county is exceptionally well adapted to dairying but up until the past year beef cattle raising has been the main live stock industry. However, due to the heavy losses on feeding cattle the last year or so, the farmers are turning to the dairy cow as a profit maker.

A committee was appointed from the farm bureau with Mr. Mudd as chairman. This committee decided that it was best to start with grade calves and later organize a club with registered calves. They had very little difficulty in signing up thirty of the most alert boys in the county for this club. The fieldman of the Southwest Jersey Cattle Breeders' Association then located a fine lot of choice heifers about a year old.

The calves were distributed on June 4th and the boys and girls are very enthusiastic over their new acquisition. On June 7th they held a meeting and organized themselves into a club with Gilmer Dyer president and Glennon Murphy secretary. They are planning to hold monthly meetings.

The local banks furnished the money to the children to buy the calves and everybody in town seems to be interested in seeing this made a success. Such clubs as this will do much good for dairying in general and Jerseys in particular and will build character in the children at the same time.

F. W. ATKESON, Fieldman.

Oregon Jerseys to be Certified

Members of the Executive Committee of the Oregon Jersey Cattle Club have adopted a resolution providing for inspection and certification of herds to be sold at auction. This makes it possible for members of the Oregon Jersey Cattle Club to obtain a guarantee from the O. J. C. C. as to quality and healthfulness of their herd. Upon application the herd is examined by a veterinarian employed by the Executive Committees. The veterinarian furnishes the Committee with an affidavit stating that he has inspected the cattle. In case they are found free from communicable disease the Committee issues a certificate of endorsement, providing they deem the quality justifiable.

The purpose of the Committee in certifying herds to be sold at auction is to protect buyers from purchasing diseased animals or animals of inferior quality. This will be a great protection to the buyers of Jersey cattle in Oregon, and together with the law enacted by our last legislature, making by-bidding unlawful and providing for a penalty, will assure clean, honorable sales. Oregon also has a pure-bred sire law which, combined with these other two protections, surely will stabilize Oregon's dairy industry.—IVAN H. LOUGHARY, Sec.

VETERINARY

Advice is given free in this department. Inquires must be signed by the writer, and should pertain to veterinary Matters only. Where an immediate reply and prescription are desired by mail, the inquiry must be accompanied by a fee of one dollar. In every instance it will be necessary to give a full description of the symptoms present.

Impacted Paunch

We often used to hear of "fardle-bound" and "dry murrain" as deadly diseases affecting cattle, but these terms have become obsolete since science has arrived at a better understanding of the conditions present. "Fardle-bound" meant impaction, clogging, or stoppage of the third stomach (manyplies or omasum) while dry feed and "dry murrain" referred to that condition or impaction of the paunch (rumen). But the contents of the third stomach always are comparatively dry, for it is the function of the "leaves" of this compartment of the stomach to rub (triturate) and compress the feed entering it. The paunch is a storage place for roughage which is returned to the mouth over and over again to be remasticated. This food, when ready for digestion, goes directly to the third stomach by way of the esophageal canal and its liquids when squeezed out enter the fourth or true digestive stomach (abomasum). Here gastric juice, hydrochloric and lactic acids, pepsin, and rennin change the food into acid chyme to become chyle in the small intestines where absorption largely occurs.

The work of the compartments of the stomach is largely dependent upon involuntary muscular action termed *peristalsis*. It is this peristaltic action which keeps the feed moving in the stomach compartments and intestines and it also has much to do with chewing of the cud and belching of gas (eructation) which occurs simultaneously. When peristalsis ceases, partially or entirely, rumination is impaired or subsides and all the functions of each of the compartments are affected according to the degree in which peristaltic action is lacking.

Impaction of the third stomach only occurs as a separate condition when its leaves have been transfixed by a wire or other sharp object. It occurs sympathetically with impaction of the paunch or rumen. All compartments are simultaneously affected and a gastro-intestinal catarrhal condition is said to be present.

Undue pressure from large quantities of coarse, dry, bulky roughage tend to cause impaction as does chill, shock, sudden change of feed, lack of drinking water, ice cold water, disease of the liver, etc. Impaction of the rumen, the major condition existing in such attacks, is indicated by doughy distention of the paunch in the left flank, giving the side and backbone a "humped up" appearance, and causing persistent or intermittent grunting, slight fever, shrink in milk, stopping of cud chewing, and usually complete or partial suppression of appetite. Feces may pass in small quantities occasionally. Urine is not suppressed. Slight fever is present. The attack tends to run a course of several days and sometimes causes craziness before death.

The old system of giving immense and repeated doses of Epsom salt in this disease has been abandoned by educated veterinarians. They now give drugs to stimulate peristaltic action and secretions of the stomach and bowels. Feed is absolutely withheld but flaxseed tea containing a teaspoonful of salt to the quart is allowed at will. Rectal injections of warm water and glycerine may help, as may massage and kneading of the paunch. Medicinal treatment consists in the administration of such drugs as strychnin and nux vomica, arecolin, eserine, or barium chlorid, and internal antiseptics such as salol or triple sulpho-carbolate tablets. The veterinarian gives appropriate doses of these drugs according to the conditions present in each case. He also administers copious doses of castor oil, raw linseed, cottonseed, or medicinal mineral oil when the treated cow again starts belching or shows signs of cud chewing.

Failure to Breed

I have a heifer that is two years old which does not come in heat. What shall I do?
Phoenixville, Pa. L. C. F.

It would be best to have a veterinarian decide by examination what is causing failure to come in heat. He may possibly be able by treatment of the ovaries to induce a period of heat, provided the heifer was not born barren. Meanwhile flush out the vagina daily with a gallon of bloodwarm boiled water containing 2 tablespoonfuls of table salt. This may help, but there is no certain way of inducing periods of heat. Read the articles on sterility which appeared in this department of the paper some time ago.

Warts on Udder

Please give me a remedy for seed warts on a cow's udder.
Chillicothe, Tex. A. M. G.

Warts that have narrow necks may be snipped off, with scissors, a few at a time. If this is done, apply a little pine tar the following day. Excessive bleeding may be stopped by bathing with very hot or very cold water; then paint the wound with tincture of iodin. Masses of small warts may be removed, in time, by immersing the affected teats for 10 minutes or more twice daily in water containing all the bicarbonate of soda it will dissolve when hot; or in a 10 per cent solution of washing soda. The strength of the last mentioned solution should be decreased one-half after the first day of use. A thick paste composed of table salt, sulphur, and cold-pressed castor oil is also effective and many people use castor oil alone, but it is slow in effect, compared with the other mixture mentioned.

Milking Machines and Milk Utensils Purified

Prevents Hot Weather Losses
Always Ready — No Muss — No Tainting

Just a small amount of B-K in your rinse water and soak jar and bacteria or germs are killed. Sterilize your milker, cans, pails, separator, strainers. No trouble. Safe, sure—low cost.

Remember the name—B-K—at all drug, general and implement stores in all sizes.

FOUR HEIFER CALVES AND A BULL, registered, transferred and crated for $375.
The heifers are fawn color, in fine condition; and from good producing dams. Heifer No. 1 was dropped December 25, 1919, No. 2 September 17, 1920, No. 3 October 17, 1920 and No. 4 March 20, 1921. Bull calf was dropped September 10, 1920, is a fine individual, will make a good show bull, his dam has a R. of M. record of 457 lbs. butter class AA, he is sired by Majesty's Ixia's Gamboge whose dam has a record of 639 lbs. butter.
W. M. KNIGHT, Oak Grove Jersey Farm, *(U. S. Accredited Herd.)* Eagle, Waukesha Co., Wis.

Counting Bacteria With a Microscope

(Continued from page 955)

test now quite widely used by American dairymen. The little cotton disc showing the dirt found in the milk can be kept as a matter of record.

Another advantage of the Frost test over other rapid methods is that it counts only the living germs in the milk. The dead bacteria are of little consequence, their activity is past—but it is the many living organisms that are constantly multiplying and causing changes in the milk. This last named advantage makes it possible to detect the healthfulness of pasteurized as well as raw milk.

Take Little Equipment

Compared to the standard plates, the little plates are not only six or more times as rapid, but they also take much less apparatus. Particularly is this true of the glassware. In order to make duplicate counts on 10 samples of milk by the new method, 10 pipettes, 10 slides, and one cubic centimeter of agar is all that is necessary. Whereas with the standard method to make the same number of counts 40 pipettes, 30 dilution bottles, 40 Petri dishes, and 400 cubic centimeters of agar are required.

Frost's Method Accurate

Many comparative tests have been run between the little plates and the other bacteriological methods commonly employed, especially with the standard plates referred to above. The standard plates have been in use for many years, and it is now largely custom that keeps them in good favor. Dr. Frost's method has weathered the comparisons very successfully. In fact, the results have been so satisfactory that the test has been included in the latest list of approved methods of milk analyses compiled by the American Public Health Association.

In several of the comparative tests, the little plates gave higher counts than did the standard plates. But this would appear to be in favor of the little plates and a more nearly correct index of the germ content of the samples tested, since the composition of the agar and milk mixture used in the little plates more closely approaches the composition of pure milk than do the constituents of the standard plates.

"Spreaders" Do Not Interfere

A technicality which is not appreciated so much by the farmer or the milk dealer as by the laboratory worker, and a thing that again gives the little plates preference over the standard plates, is the fact that much less trouble is experienced with "spreaders" on the little plates than on the standard. "Spreaders" are colonies which spread out over all or part of the plate, disturbing the growth of other colonies and making an accurate count of the colonies impossible.

A summary of this new method for counting bacteria in milk shows that: (1) Its accuracy equals that of the old method. (2) It requires only 8 instead of 48 hours. (3) It gives a permanent record, and (4) it economizes on culture media and glassware.

Identifying Hardy Alfalfa

So important is the matter of securing dependable alfalfa seed that L. F. Graber, secretary of the Wisconsin Alfalfa Growers' Association, has tested over six hundred samples of seed collected from various parts of the state in a total of 1280 demonstration plots. In 1920, 360 plots were sown and demonstrations are being carried on in eight different localities in the southern part of the state.

A method of distinguishing between genuine and non-genuine Grimm, Baltic, and Cossock varieties has been discovered. It is based on the action of the various strains of alfalfa following the last cutting in the fall, the genuine hardy variety showing fall dormancy, strictly different from the common strains of alfalfa. This fall dormancy sets in at a comparatively early date, while the common varieties continue to grow throughout the fall, especially when there is plenty of rainfall. It is possible, therefore, during the first season of growth to distinguish hardy from non-hardy varieties and determine the genuineness of the seed sown.

When writing advertisers please mention Hoard's Dairyman.

Born March 18, 1921

His sire is a son of KING LYONS, out of a 35-lb. daughter of KING SEGIS.
His dam is a 25.81-lb. daughter of JOHANNA KING SEGIS, a 40-lb. grandson of KING SEGIS.
For pedigree and price write:
G. G. Burlingame, Cazenovia, N. Y

Choice At $100

of four yearling bulls. Sire, Joh Segis. 15 nearest dams average 30 lbs. His dam gave 710 lbs. milk in 7 days. Dams and Grandams—A. R. O. cows up to 24.74 lbs. Federally tested by all three tests.
HENRY J. KARPINSKI, R-7, Oswego, N. Y.

Respectfully Submitted:

Every effort to create new markets for Holsteins is entitled to your prompt, practical and punchful-co-operation. On August 8, 1921, I shall offer forty head of THE breed at auction. All bred in the deep purple, all classy individuals; all pail-profit producers along with such high grade, healthy and "typy" individuals as you may consign to this sale. I want to make Victory Farms a market place of International importance to the Breed and must have your generous, practical help NOW. If you have nothing to sell, come and buy. Bring the folks. If you decide to participate as a seller ship tested, "clean," guaranteed stock via Reeding System to Victory Farms, Doylestown, Pa. References: Dun, Bradstreets, Middle City Bank, Philadelphia, Pa.; West End Trust Company, Philadelphia, Pa.; Solebury National Bank, New Hope, Pa. Monday, August 8, 1921, is the date. Victory Farms, Doylestown, Pa., is the place. Ship "clean" stock. Come along yourself.

Registered Cows and Heifers

We have on hand more females than we usually carry so are able to offer some good ones for sale. A number have A. R. O. records and most of them are from tested dams. Bred to a yearly record sire and themselves backed by yearly producers.

Address correspondence to Axel Hansen, formerly with John B. Irwin.

MINERAL SPRINGS STOCK FARM, - - SAVAGE, MINNESOTA
Stuart—McIntyre—Hansen, Owners.

Address correspondence to Axel Hansen, formerly with John B. Irwin.

Lola Segis Pontiac Homestead

the highest record bull in southern Minnesota, heads our herd. His sire, Piebe Laura Ollie Homestead King, has more daughters that as 2-yr.-olds have produced 20,000 lbs. milk in a year than any other. His dam, a 34-lb. 4-year-old daughter of King Segis Pontiac Count, has 3 records averaging 33 lbs. and has made over 1,000 lbs. in 1 year. We have a few serviceable bulls and younger from A. R. O. dams for sale.

Clover Lea Farm, W. W. Walker, Owner. Austin, Minnesota

Sir Walker Segis Homestead

The best show bull and son of the great bull, PIEBE LAURA OLLIE HOMESTEAD, out of a "COUNT" daughter, BEAUTY BEETS WALKER SEGIS, world's greatest heifer, with two yearly records over 25,000 lbs. milk and 1,000 lbs. butter in heifer form, and a seven-day record of 35.03 lbs. butter from 730 lbs. milk.

We offer several choice bulls, one month to a year old, out of high yearly record and A. R. O. cows, at very reasonable present day prices. Pedigrees and photos will be sent.

A. J. LASHBROOK, - - Northfield, Minnesota

Here's Another Serviceable Son of King Segis Pontiac Fayne Star

Born March 17, 1920, a splendid individual nearly white.
His dam a 16-lb. 2-year-old with a good 305-day 2-year-old record, one good enough to win a share of association prize money for 1919-1920. She by a grandson of Homestead Junior De Kol.

Fayne Star Sir Wayne is a Bargain at $400

Flecks Farms **Faribault, Minn.**

---

6 Good Cows For Sale

THE MINNESOTA KIND

They are all by a 36-lb. sire, are bred to a son of King Korndyke Colantha Ormsby, and are due to freshen this fall and winter. They are from 3 to 5 years old and absolutely straight and right. Lack of barn room forces us to sell.
Write or come and see them.

E. J. Brosious, - Stillwater, Minn.

A LINE-BRED "41st" BULL CALF FOR SALE

SIR PIETERTJE ORMSBY BESS BURKE
Born Dec. 20, 1920

A real showy calf, straight as a line and of ORMSBY type

His dam and sire's dam are both daughters of SIR PIETERTJE ORMSBY MERCEDES 41ST, the only son of Spring Brook Bess Burke. His dam is on yearly test as a junior two-year-old and bids fair to go 800 lbs. The sire's dam made 28.93 as a 3-year-old and 26.82 as a 2-year-old.

THIS CALF WILL GROW INTO MONEY —SEND FOR PHOTOS, PEDIGREE AND FULL PARTICULARS.

E. C. Schroeder Farms

(Under Federal Supervision)

MOORHEAD, Minnesota

Registered Young Holstein-Friesian Herd For Sale

7 cows, 3 heifers, 1 bull, 20 months. Cows sired by 20-lb. son of King Korndyke Colantha Ormsby, sire of several 30-lb. cows. 3 are line bred A. & G. De Freule DeKol 2nd, a 29.68-lb. cow with proven transmitting ability. Others are from granddaughters of famous old Duchess Ormsby Piebe Burke with 33 A. R. O. daughters, some world and state records. Some due to freshen soon, some early fall and winter, several just fresh. Herd Federal Accredited, guaranteed in every respect. Age up to one 6-year-old, mostly three-year-olds. Price $2,750.

WM. SAARI, Phone 316, Finlayson, Minn.

"DUKE"

The only place you can buy sons of serviceable age sired by DUKE PIETERTJE KORNDYKE ORMSBY

The bull selling at the last Minnesota state sale for $33,000.00 is from the herd where he stood for three years prior to the sale. "Duke's" dam now has three records above 1,000 pounds, the last one was 1,190 pounds.
Now is the opportune time to buy one of these bulls as their sisters will be given every opportunity. Get a son now and be in line. Clean bulls from a clean herd. Prices reasonable. Write

EDW. H. ULRICH, Biscay, Minn.

REGISTERED BULLS

FROM TESTED DAMS

Sired by a 30-lb. son of Colantha Johanna Lad and a 26½-lb. son of Laura Piebe Ollie Homestead King. Well marked, straight individuals from two months to 2 years old. Priced to suit present conditions.

GEO. H. ELWELL,
Minneapolis, Minnesota.

Get A Calf

We have a grand bunch of youngsters on hand. Come and pick out a calf while you have a big choice. Grow him to suit you. Saves you money and we are selling them as cheaply as we can. Show calves that are backed by generations of official testing and careful breeding. Sons of DUTCHLAND CREAMELLE COLANTHA LAD No. 165049. His yearly daughters all average over 834 lbs. of butter at 26 months of age.

GRAHAMHOLM FARMS,
H. R. Searles, Mgr., Rochester, Minn.

Choice Ormsby Bulls

From good record dams. Priced from $150 to $700. A few higher. Tell us your wants, or better still, come and see us.

MANKATO HOLSTEIN FARMS
Marlow & Randall, Mankato, Minn.

Grandsons of Sir Pietertje Ormsby Mercedes

The sire is Sir Pietertje Ormsby Mercedes 22d, a son of Minnesota's first 1000-lb. cow. These bulls are all nicely marked, straight top lines. Very good individuals from good A. R. O. dams.

For pedigrees and prices, write

O. J. GROVER, - GLYNDON, MINN.

Registered Holsteins

For Sale—Four heifers from good sires and tested dams. Bred to our 34-lb. sire, Count and Piebe breeding. Are good individuals, priced $1,175. Herd under State supervision.

BLACK & WHITE STOCK FARM, Melrose, Minn.

Success Insurance

"A Son of Count"

Suppose someone offered to insure your future success as a breeder and charge you only a small premium. Would you pass up such an opportunity? Not many of you would.

Oak Dale is offering some breeder the chance of a lifetime to buy herd insurance. The offer comes in the shape of a young Bull, a son of King Segis Pontiac Count, the greatest sire of all times.

"Count" has more daughters with over 700 lbs. milk than any other living sire. He is the only sire that ever lived with three daughters with over 700 lbs. milk under full age. He has more daughters with records above 1,000 lbs. butter than any other living sire. His daughters have won more first prizes in the past five years than the daughters of any other sire in a lifetime.

Buffalo Lois Beets, the dam, seven days 22 lbs. butter, is by a son of Paul Beets De Kol. One of this great bull's grandsons is the sire of the present world champion four-year-old. Buffalo Lois Beets bears the same relation to Paul Beets De Kol as does the sire of this world champion 46-lb. four-year-old.

This young bull traces twice to Pontiac Korndyke, Hengerveld De Kol, King Segis and King of the Pontiacs; once to Paul Beets De Kol and Sarcastic Lad. Thus, in the first five generations he has represented six of the greatest bulls the breed has ever known.

Is this herd insurance or not? Figure it out for yourself. The price of this bull is so reasonable that anyone can afford to pay it.

Write for complete information or come and see him, if you can. The farm is on the Oak Dale Trail at Blooming Prairie, Minnesota.

OAK DALE FARMS

Make this Chart your Guide

for Correct Automobile Lubrication

Chart of Recommendations

(Abbreviated Edition)

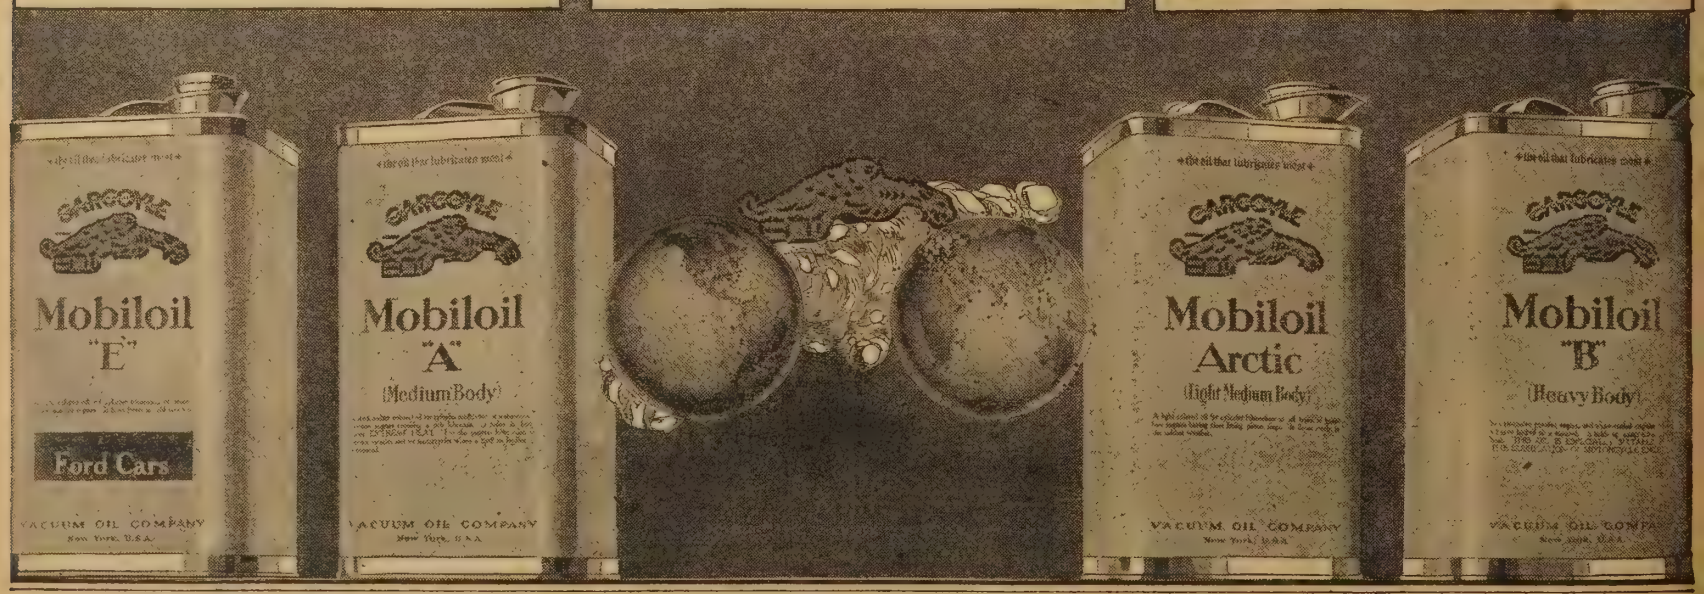
How to Read the Chart:

THE correct grades of Gargoyle Mobiloils for engine lubrication of both passenger and commercial cars are specified in the Chart below.

A means Gargoyle Mobiloil "A"
B means Gargoyle Mobiloil "B"
E means Gargoyle Mobiloil "E"
Arc means Gargoyle Mobiloil Arctic

Where different grades are recommended for summer and winter use, the winter recommendations should be followed during the entire period when freezing temperatures may be experienced.

The recommendations for prominent makes of engines used in many cars are listed separately for convenience.



The Chart of Recommendations is compiled by the Vacuum Oil Company's Board of Automotive Engineers, and represents our professional advice on correct automobile lubrication.

GOODYEAR

Copyright 1921, by The Goodyear Tire & Rubber Co.

GOODYEAR Tires have always been notable for economy. Year after year, they have returned their users great service at little cost. Today, they are better tires than they have ever been before. In the past few months we have made more improvements in them than in any like period in our history. Goodyear Tires are now larger, heavier, stronger. In every size, they are stouter and more durable. If you want on your car the most economical tire equipment obtainable—buy Goodyear Tires. More people ride on Goodyear Tires than on any other kind.

TRACTORS AND SILOS

F. L. CLARK, IOWA

"THE tractor is having a direct influence in increasing silo-building on farms," said an Iowa dairy farmer the other day, who has this year added a tractor to his farm equipment and at silo-filling time made use of it to run the cutter. Formerly he had used a steam engine.

"The tractor way is so much simpler, less expensive, and convenient than waiting your turn at a hired steam outfit," he said, "that it is a real inducement to add a silo as soon as you have a tractor if you haven't one before. Silo filling is not a job that farmers can very well put off until the steam engine outfit is ready to give a day. When corn is ready for ensilage it has to be tended to. A tractor on the farm means no delay such as used to be experienced when a steam outfit had to be requisitioned.

"Then, too, the tractor lessens the cost of filling the silo. The fuel cost is less and less help is required. The steam engine needs men to fire it and haul water for it."

That the tractor has become almost universally the power silo filler one only needed to drive along the roads of Iowa during the latter part of September last year to discover.

At the same time the photograph used in the accompanying illustration was taken, a half dozen other tractors in the Kinsley neighborhood were performing the same job and there were about as many different makes of tractors as there were silos. This would lead to the deduction that a tractor is a power unit at silo filling time, whether it is big or little, cheap or expensive or what not.

SILO FILLING ON FARM OF KINSLEY BROS., IOWA

Use of Milk Increases

Forty-four gallons of milk is used by each person in the United States annually, according to estimates made by the Dairy Division of the United States Department of Agriculture. This estimate refers to whole milk and does not include that which is consumed in the form of ice cream, cheese, and butter. The amount is about twice as much as that used in 1890 when the per capita consumption was approximately 22 gallons. The dairy specialists point out that the increase in the use of milk in the last 30 years is as great as that in the preceding 280 years.

The present-day consumption of milk in the United States, they say, is equal to about one pint per day, or as much as two small glasses. That is not a great amount when it is known that it includes not only the milk that is used for drinking, but also that used in cooking. This is a small amount compared to the per capita consumption in some European countries. In Sweden and Switzerland, for example, nearly 70 gallons are used by each person annually.

Ancient German Tribes Lived on Milk

A high value has always been placed on cows in many European countries, and history records a campaign conducted by Julius Caesar in central Europe where he found German tribes living almost exclusively on milk. In order to provide pastures for their cows they forcibly resisted the settlement of any people near them.

In relating the growth of the dairy industry in this country, the department specialists say that in pioneer days each family kept its own cow. The denser the population became the more important it was to have a well regulated and ample commercial supply of milk. Gradually the number of cows increased, and in time a dairy business grew up in various sections. The development of modern methods in the distribution of milk, with economic and sanitary handling, has been closely accompanied by the larger use of this food, they say.

Much of the milk now used in cities comes many miles, and recently improved methods have made it possible to ship it for long distances in refrigerator cars. At the National Dairy Show in Chicago in 1919, milk shipped from the Pacific Coast took first prize in the market milk competition with the highest score ever given to milk in recent years.

Cities have always used a smaller amount of milk in proportion to the number of people than general farming communities, the statistics show. For example, Philadelphia reached the rate of 23 gallons per capita in 1905, which was 15 years later than the country at large reached a consumption of 22 gallons. There are, however, many agricultural and non-agricultural rural districts where cows are not kept and where modern methods of milk distribution are not equal to most cities. The people in such places have to depend on canned milk of various kinds, and this, the dairymen say, is an exceedingly valuable means of supplying a need which 20 or 30 years ago could not have been supplied at all.—U. S. Department of Agriculture.

Some farmers immunize their spring pigs and some just let the cholera get 'em.

DOLLING UP THE DAIRY COW

WM. R. PAGE, IOWA

WHY is it that live stock of all kinds is so much admired at big shows and sales?

Most of you will say, "That is easy. Why shouldn't people admire animals of such superlative quality?" You are only half right. It is true that show stock is usually of a higher grade than the common run of animals to be seen over the countryside, yet, if these same animals were later seen in their working clothes, but few people would be able to recognize them and, if seen before being fitted for show, they would probably laugh at the idea of the same animal even being considered as a show prospect. Fitting is important for just that reason. It makes it possible to show off an animal's good points to advantage and helps to cover up the poor points. The first impression that a judge gets when an animal is being led into the ring is often the main factor in settling his opinion. A good animal poorly fitted may not receive sufficient attention from a judge to give it a place over a somewhat poorer animal that may be very well fitted. Nor can the judge be given all the blame, for he must judge them as they appear that day. Few judges are good prophets. They are not expected to be. The best fitted individual has the advantage.

There is much criticism concerning the harmful effects brought to stock by the methods that are usually practiced in fitting dairy or other animals for show or sale. And there is no disputing the facts. However, much of the harm is incurred by extreme practices that some showmen entertain just for the sake of the last hair in appearances. Injury may result from rushing the prospects too fast from the first, because of the lack of time to otherwise secure the desired results. And finally it may happen through purely gross ignorance on the part of the fitter.

As an example of what can be done with an animal on the show circuit we have the Jersey cow, Beechland's Champion Lilly. She freshened on Feb. 16, 1916, and in 365 days gave 11,627.4 lbs. of milk and 628 lbs. of fat. During this time she was on the show circuit six months and won a considerable share of the ribbons offered in her class. She dropped a vigorous bull calf on April 4, the following year, and, when put on test for that year, she gave 14,355.6 lbs. milk and 829.26 lbs. fat, finishing her test in first class physical condition. Showing surely did no great harm to that cow, either from a production or a breeding standpoint. If good common sense methods are employed one need not worry for the welfare of his show stock.

Selection of your show prospects is the first step in the business of preparing a herd for the fairs. It is self evident that a knowledge of your breed's standard is essential to a judicious selection of the individual. In addition the stock selected should be as uniform as possible. A uniform herd stamps the exhibitor as a true breeder and speaks especially well for his herd sire. It is next to impossible to make a strong impression on the public with a motley herd of animals, no two of which are alike, even though they may be good individuals. Uniformity is especially desirable in the herd and get of sire classes. If you must choose between two animals for the above classes, one of which is the same type as the rest of the class but somewhat inferior in quality compared to the other which is of a different type, it is nearly always safe to pick the poorer individual which has the desired type.

The time to select your show prospects may be a year ahead of the date of showing. This is particularly true when selecting cows for the aged classes where freshness and bloom are so important in competition with fast company. The cow is chosen early and bred to freshen just about the time of showing. This enables her to show at her best but of course when making a full show circuit it is manifestly impossible to keep a cow in that condition for all the shows. Then the most important show should be chosen as the time to have the cow at her best. The fitting proper should begin from three months to six weeks ahead of the show. The first date is the safer, but conditions may not warrant spending so much time on your cattle and very good results can be obtained in six weeks' time for ordinary competition.

The cows should be put in the barn and kept there most of the time. They should be allowed to go outside for exercise only. This should be given in the cooler parts of the day or at night. They should be kept free from the hot sun for it tends to harden the skin and to remove the luster from the hair. While they are in the barn, supply them with a liberal amount of bedding and keep the barn in semi-darkness if flies are bad. If the coats of the animals are rough and shaggy or seem slow to shed it will be necessary to clip them. At any rate clip all the long hair from the under parts and from the milk veins in order to show them to the best advantage. The head and ears should be clipped to give an impression of quality. The tail is always trimmed from the switch to the tail setting. It may be necessary to clip some parts more than once during the fiting period to keep your prospect looking at its best.

The question of blanketing the show animals is a much debated one and successful showmen do not agree on their use themselves. Heavy blanketing during the early part of the fitting period will soften the hide and give gloss to the hair. When the desired softness is obtained lighter blankets are used merely to keep off the flies and to keep the hide clean. Those who do not use blankets claim less dangers from colds; and the softness of the skin is secured by extra brushing and rubbing of the hide. For quick results blanketing is the surer method but conditions must determine their use or non-use.

The feet should be trimmed so that the individual will stand squarely and evenly upon them. This is quite essential in securing stylishness in the animal, both while standing and while at the walks. The hoofs may be rasped to smoothness and just before showing they should be rubbed with a rag and a trace of sweet oil to give them a dull luster.

The feed for show cattle should be as nearly as possible like that which you will be able to secure while at the shows. If but one show is to be undertaken that is not so important for it is usually possible to coax along the cattle for a few days on any good feed even though it is different from that fed at home. A good grain ration, to be fed three times daily, is oats, 100 lbs.; wheat bran, 200 lbs.; corn, 100 lbs.; linseed oil meal, 100 lbs., and salt 1 per cent. The linseed oil meal is helpful in giving a gloss to the hair and in keeping the animal in good tone. Mixed hay is allowed freely and some roots or green feeds may be given as a relish, but not too freely. Watch the general condition of the animal by observing the appetite, eye, hair, skin, and bowels. If one should go off her feed, give immediate attention by changing the ration to suit the needs of the individual.

Grooming and training the animals for their appearance in the show ring should be thoroughly done. For the first couple weeks a good stiff brushing should be given twice daily. After that softer brushes should be used assisted by rubbing down with a woolen rag and, as a finish, vigorous rubbing of the hide with the palm of the hand. Nothing gives a better gloss to the hair than plenty of elbow grease and the open palm. Wash the cattle thoroughly when they are first put into the barn by using lukewarm water and plenty of tar soap. This should be repeated every day until the skin is thoroughly clean and after that the hair may be sponged off with a suds made of tincture of green soap and warm water. After sponging, rub the hair dry and apply, very sparingly, on a woolen rag, a mixture of sweet oil and alcohol, half and half. Now rub down well with the palm of the hand and the coat will soon have a brilliant gloss.

The stock should be led out every day and taught to pose in approved fashion. Some will show to the best advantage when posed in one way while others will show best in another. Study your animals to secure the best effects. It is well to give strangers an opportunity to handle them at this time for it will teach the cattle not to be so excited when the judge commences to work on them in the ring. This training will help to supply the much needed exercise that the cattle should have. Also turn them outside for a few hours every day when the weather is favorable.

Nothing adds so much of beauty to a good dairy animal as a shapely pair of horns brightly polished. The outer rough portion may be removed by the use of a rounded wood rasp. This is followed by the use of a steel scraper or a piece of broken glass, which does

(Continued on page 997)

HOLSTEIN COW, ARCADIA SEGIS ATIA 2ND, SOLD FOR $4,250 TO M. MONTGOMERY, SOUTH CAROLINA, AT THE 1921 NATIONAL HOLSTEIN SALE

PRACTICAL DAIRY MANAGEMENT

A. W. ABBOTT, MAINE

IT has been said that to raise a really perfect cow a breeder should not expect results for 20 years hence. But to raise good cows the care given the dam is absolutely necessary. The method given below is one practiced by the writer and, with figures in dollars and cents to bear him out, we feel sure this method will be of value to some that are starting with dairy cows and others who desire a change of their present method of handling their cattle.

Five years ago, on an ordinary farm in Eastern New England, the purchase of fifteen grade cows marked the beginning. With timothy hay and high priced grains a start was made toward producing milk, but the figures showed at the end of the first year that such a method was far from the correct one in profitable dairying.

The next year the raising of green feeds and corn silage helped materially and, with the sale of all boarder cows, the balance in the cash book at the year's end showed great improvement over the one preceding. Not until the fourth and fifth years, however, when the establishment of the present system was well grounded, could we show a nice yearly profit in raising cattle for milk production.

Home Grown Feeds

The raising of all feeds that can be economically cared for by the eastern dairy farmer and utilized at a profit by the cow, was the beginning. The following system was then adopted:

We find from the first to the tenth of September the ideal time for sowing winter rye and vetch. The vetch makes ideal green feed for the dairy cow, being ready in our climate for feed by the last of May. Through its root system, which is heavily coated with nitrogen nodules, we get valuable fertilizing elements for the soil, thereby gaining a food and a fertilizer in the one crop. The rye serves as a nurse crop for the vetch and is selected in combination because of its hardiness and a price which is less than any of the fall grains. To the dairyman who is planning to rejuvenate his worn-out pasture our advice would be to try a fall sowing of the above crops and gain a spring feed which for the dairy cow has few equals.

Very early in spring or as soon as you can get your land ready, sow two acres of peas and oats for twenty-five head of milk cows. This amount will allow some for cutting into the summer silo.

The latter part of May or first of June sow alfalfa and the clovers. Alfalfa will survive on our eastern dairy farms if some essentials and care in the beginning are carefully followed. For a successful crop of alfalfa the variety, time of sowing, use of lime, and inoculating the seed spells success or defeat in growing this legume crop. Grimm has proven the most hardy variety with the writer and the use of at least 2,500 pounds of lime per acre is necessary for results. Alfalfa will not survive the winters in our climate on low land, therefore high and well drained soil *must be selected.* Inoculation is simple and consists merely of soaking the seed in alfalfa culture before sowing.

Clover is likewise one of our best soil enrichers, so that when we plant this wonderful feed we benefit to the fullest degree our herd and our land.

Lime is as essential with clover as with alfalfa and must be supplied during soil preparation for the clover crop. With clover, as with vetch, a nurse crop is needed in order to insure a good catch the first year, and help choke out the weeds.

Red clover, alsike, and mammoth are the three most popular clovers. Red clover gives practically two yields and alsike is fine in that it is adapted to damp soils and makes for permanent hay. Just now the writer is experimenting with an annual sweet clover which gives promise of excelling any of the above varieties. It grows much thicker, appears hardier for our climate, and furnishes nearly twice as much forage per acre as the other clovers mentioned. More accurate results will be ready later as to the feeding value and money values of this crop.

Hungarian grasses and millet belong on the list of home-grown feeds for the practical feeder. They are very easy to raise, being adapted to almost any kind of soil, can be sown late, and can be utilized both green or for hay. Have also used this crop in the summer silo to advantage.

Six to eight acres of ensilage corn completes the list of roughages adaptable to our conditions for 25 head of cattle. First select a variety that will ear out well. New York Flint is an ideal variety in that under average growing seasons it produces ears by September 15th well filled out, and in number, two to each stalk. No dairyman should consider his corn field complete or successful without some protein feed in combination. My results prove that soy beans are most excellent grown with the corn. Soy beans are hardy and large yielders, are not choked out by the corn, and add to the feed value of the combination considerably because protein at the rate of 12% is contained in the beans. Like all legume crops the soy bean root system contains nitrogen nodules and these plowed into the soil after harvest time add nitrogen to a soil that has been somewhat depleted by the corn.

Care and Management of the Cow

In the care and management of the dairy cow select a system adapted to your own conditions, reinforced by proven ideas regarding feeding and breeding of dairy cattle. To the beginner let me suggest a few fundamentals that success has proven to me must be carefully adhered to.

No dairy cow ever filled a large milk pail brimming full twice a day or kept herself in "fine order" without the observance of regularity by her attendant or feeder.

With me, water kept before the herd at all times is the better way. Regular and frequent waterings will do; but a cow that has access to water both day and night will excel the cow not having continual access to water to the tune of one pound to three pounds of milk per day.

Feeding the dairy cow should be considered very carefully. She must be fed at practically the same hour each day, whether the number of feedings be two, three, or more. Regularity in milking will guarantee the owner from one pound to three pounds of milk a day more than can be obtained from the cow milked "as our conscience calls". Keep your dairy herd well groomed and do it at the same time each day, lest it will not be done at all.

In the care of the dairy herd the number of feedings necessary per day is a much debated question and results obtained are somewhat variable. You hear of the "way down East" farmer who still feeds his cows seven times a day, but this is both expensive and impractical. I have personally experimented and kept figures on milk production and feedings cost for two and three feedings a day with following results:

Three feedings per day showed an increase in amount of hay fed and in labor expense, with not much gain in milk production.

Two feedings per day shows saving in hay somewhat, practically as much milk, and the labor of extra feeding saved. The above system applies to the dairyman running a practical herd of 25 cows under average farm conditions.

The management of the dairy cow throughout the entire year is of great importance, but the period just before calving is doubly so. It is during the dry period, which should be from six to eight weeks before calving, that real flesh can and should be put on the cow. A carefully selected grain ration should be fed during this time, such as 200 lbs. bran, 100 lbs. ground oats, 100 lbs. oil meal, and 100 lbs. hominy.

Just previous to calving this ration can be made more laxative by increasing the bran and omitting the hominy, which is desirable.

Feeding the Individual Cow

After calving the practical feeder has the task of finding out the possibilities of his animal. I venture the fact that not more than one cow in twenty, yes even greater than that, ever proves her possibilities to her owner. And it is because she is not allowed to or is not forced to show her real worth. Feeding for milk production is a real science and comes only by experience and careful study of each individual fed. Some points worthy of consideration, however, are here recorded from the writer's experience in feeding dairy cattle:

1. Be regular, both in feeding and milking.

2. After calving do not be over anxious to feed heavy at once. Rather work the cow along slowly by increasing her ration a little at a time.

3. Increase the grain ration just so long as the milk sheet shows an increase in pounds of milk each day.

4. When the cow has reached her limit for the grain ration fed, do not increase the number of pounds any longer; increase the protein in the ration and feed same amount of ration to the cow as previous.

5. Ensilage is a vital necessity to furnish winter forage for the cows. Plan now for your spring planting and have a full silo next winter.

6. Roots, ground beets, or beet pulp for the high producing cow that is fed plenty of grain are essential as they cool the digestive system which is being worked to its fullest capacity.

7. Be faithful, gentle, and human to your cows and you will soon discover possibilities in each individual that you never dreamed were possible.

A milk ration for results, based on the present market prices, is as follows: 500 lbs. bran, 300 lbs. ground oats, 200 lbs. gluten, 200 lbs. hominy, 300 lbs. cottonseed, 100 lbs. linseed meal, and 14 lbs. salt.

Breeding Pure-bred Stock

The advanced and far-sighted dairyman of today is looking forward to the breeding of pure-bred stock as the ultimate goal of his dairy proposition. The method of stock improvement is the only real means of getting rid of a cow that gives but 3,000 pounds of milk a year and replace her by a cow that gives 6,000 pounds each year, and so on. Right here is where real profit begins. Again, a man in breeding pure-breds is able to place his stock on the market at a figure that cannot be compared with the amount an average grade cow will bring, while the cost of raising registered cattle is but a trifle more per head than that of raising the grade or scrub. There is also the feeling of satisfaction that enters into the daily work when a man who loves good cattle and is willing to devote time in caring for them is breeding pure-breds.

As soon as you select one or more cows of a certain strain to serve you as foundation stock, select a bull of this strain and get the best bred bull you can afford to buy. The purchase of a cheap bull is the worst kind of folly to the breeder who is looking into the future. Do not pick out as a herd sire an animal whose pedigree shows no resemblance to that of your females.

A shrewd and successful breeder is one who looks after the details; and, when all is said and done, it is the details that form the foundation for the entire breeding work. It is rightly said: "See to it that the fundamentals are correct and then everything is correct."

Breeding work is not a get-rich-quick adventure, but it is a sound, sane, and logical business. To succeed will take years of faithful guiding and study. A successful breeder must have patience, knowledge, a love for animal life, and an untiring disposition, and can only expect results as he devotes these requirements to his enterprise.

FIRST ANNUAL FIELD DAY OF MAINE LIVE STOCK BREEDERS' ASSOCIATION HELD ON ABBOTT FARM

A Successful Co-operative Creamery

THE sceptic says that it can't be done; co-operation is not a success, for farmers cannot adjust themselves so they will work together to their mutual advantage.

The farmers' co-operative creamery of Pelican Rapids, Minnesota, has refuted the statement "that it can't be done", for in less than ten years they have developed one of the best co-operative creameries in the United States and have increased the production of dairy products in that community. They have not only interested themselves in the handling of milk and cream produced by farmers in that section, but they have provided facilities for handling their poultry and eggs.

In the year 1911 there was a private creamery at Pelican Rapids and previous to that a creamery built by farmers and business men which was a promoters' creamery and, being premature, did not receive proper support from the farmers and consequently failed. The people who invested in it lost money. The failure of this creamery caused many to be sceptical of the present organization when it was started but the private creamery did not give satisfaction and it led those who believe in the co-operative creamery to again attempt to establish such an institution at Pelican Rapids.

Several meetings were held by the farmers the latter part of 1911 and on February 8, 1912, an organization was perfected and it was voted to build a new creamery; this building to be 70x30 ft., one story, and to cost about $4,000. It was uphill work and much harder to raise the $4,000 at that time than it was to raise $70,000 in 1920 for the new creamery which is illustrated on this page. In May, 1912, Mr. M. Sorensen was engaged as manager of the first creamery. It looked rather dubious to start this creamery as the sixth place for receiving cream, but they succeeded, and on July 17, 1912, the first butter was made, and in six months 96,000 lbs. of butter were made which sold for $26,000.

This creamery being properly managed and giving good returns to the farmers, led a number of them to purchase dairy cattle the following October. It also led the farmers to start a cow testing association for they desired to establish herds of cows that would be profitable milk producers. The work of testing has continued and there is a marked improvement in the quality of the herds in that section.

In 1918 the creamery management became interested in eggs and handled them for their patrons. This paid so well that the following year poultry was handled. In the meantime the production of butter had grown to such an extent that the old building was inadequate and so at the annual meeting of 1919 it was unanimously voted to erect a new building, and in two weeks $60,000 was raised for that purpose. It was decided to build large enough so that future business could be easily taken care of and in December, 1920, the new creamery was constructed. It is equipped so that over 1,000,000 lbs. of butter can be made yearly and a carload of eggs handled per week, besides cheese and also a freezing room for dressed poultry. It is their intention, however, to handle poultry in the old creamery. In 1920, 552,000 lbs. of butter were made and 150,000 dozens of eggs and about $28,000 worth of live and dressed poultry handled.

FARMERS' CO-OPERATIVE CREAMERY, PELICAN RAPIDS, MINNESOTA

There are no local markets to speak of. Pelican Rapids is located at the end of the branch line of the Great Northern and has about 1,150 inhabitants, hence the markets for their products are through regular channels.

The success of this creamery is attributed to the good co-operative spirit prevailing among its patrons and to the capable management of Mr. M. Sorensen.

The present board of directors consists of P. K. Peterson, Herb. Halloway, Julius Holen, J. E. Maasjo, W. W. Sherman, A. P. Restad, and Carl E. Johnson. The same men were practically in control at the beginning of the organization and it is reported not a single quarrel has occurred within the association in the eight years it has been in existence.

The creamery is patronized by about 500 dairy farmers. Many are small, but all are taking an active interest in the development of their creamery and nearly everyone has a share in this institution. Their products are all graded and paid for according to grade; this shows that it is possible to grade dairy products and pay for them according to their market value.

Just recently a meeting was held by the patrons of this creamery and they report that several herds have been submitted to the officials of the Minnesota Live Stock Sanitary Board to be placed on the Accredited Tuberculosis-Free herd list.

The accomplishments of this creamery show what can be done when there exists among the patrons the true spirit of co-operation and when they are led by a capable and energetic manager.

What Does It Cost To Grow Alfalfa?

JAMES LACEY, WISCONSIN

IS alfalfa an expensive crop to grow in soils which are deficient in limestone? Does it pay to lime acid soils for the purpose of producing alfalfa? Under ordinary conditions, will the returns from an acre of alfalfa justify the expense and labor incident to its successful production?

These are questions which must be met by county agents and extension workers during the spring seeding season each year. If men who are interested in alfalfa production, but who are afraid to attempt it because of expense entailed, can be shown that the cost of production per acre or per ton is sufficiently low to allow a handsome profit per acre per year, it is a safe bet that the doubtful ones can be very easily converted to the ranks of alfalfa enthusiasts.

A 30-INCH GROWTH OF GRIMM ALFALFA, THE RESULT OF STARTING RIGHT

Figures will not lie. However, definite figures on cost of production are very difficult to obtain. Seasonal conditions exert a strong influence on production costs. Type of soil and location of the farm are other factors which have considerable bearing on the expense of alfalfa growing. But since we must draw the line somewhere, we can come very close to production figures by taking an average farm which is properly managed and which is growing alfalfa successfully despite numerous handicaps which are bound to arise.

Mr. G. B. Horner, a man who has had signal success in growing alfalfa in Green Lake County, Wisconsin, has been kind enough to furnish the cost of production figures on a twenty-acre field of alfalfa which he is planting this year. I might say, in passing, that the soil on which the alfalfa is being grown on the Horner farm was extremely sour—four tons of ground limestone per acre were needed to correct the acidity—and that the farm itself is located eight miles from the nearest source of agricultural lime. Nevertheless this field was limed with the required amount obtained at a point eight miles away. The lime was delivered by truck, dumped on the field, and spread a few weeks later.

In a recent letter from Mr. Horner he states: "Assuming ordinary conditions, viz., land plowed in fall, limed in the fall, fitted in the spring and the alfalfa sown—with a nurse crop of barley or oats—costs would work about as follows:

Plowing—1 acre (2 bottom gang, 1 man, 4 horses, 6 acres per day)	$ .80
Limestone, 4 tons at $3	12.00
Cultivating (spring)	.40
Spring tooth (spring)	.40
Drag (spring)	.35
Seeding (spring)	.40
Spreading limestone (fall)	.90
Seed 15 lbs. Grimm at 60c	9.00
Oats 2½ bu. at 40c	1.00
Total	$25.25

"This gives a total cost of $25.25 per acre without figuring the interest charge. Now, if we assume that the average field of alfalfa lasts for three years, the cost per acre, per year will be one-third of $25.25, or $8.42. Interest charges on $250 per acre land at 6% will amount to $15.00 and this added to the $8.42 makes a total cost of $23.42 per acre, per year. Ton cost on the basis of 3 tons per acre would seem to be about $7.81."

Mr. Horner continues: "In this estimate (which is really only an estimate because of the many other factors which may enter into the problem) a plow outfit, two bottom gang, one man and four horses, is assumed to cost $4.80 per day, and to plow six acres of land. A cultivating outfit is supposed to cost the same, and to handle twelve acres per day, and a spring tooth harrow outfit to cost and handle the same amount. A common field drag will cost the same per day, but will handle a slightly larger area while the figures on the seeding outfit, consisting of one drill and three horses, should be the same as those for the dragging operation. The spreading outfit, one lime sower, two men and two horses, costs six dollars per day, and will handle twenty-six tons daily.

"You will note that no value is allowed for the nurse crop, which of course will produce some grain. On the other hand, an average of three tons per acre of hay is assumed for each year over a three-year period, so the returns from the nurse crop will take care of the interest for the additional year."

On the Horner farm last year a ten-acre field of alfalfa, which was planted in 1919, yielded an average of four and one-half tons of hay per acre. This hay could very readily have been sold on the farm at $25 per ton. This exceptional yield was also grown on a field which was of strong acidity, and required four tons of limestone per acre for neutralization.

The instance cited above is only one of several in Green Lake County in which the production of alfalfa has proved to be a profitable practice on soils which are naturally acid in character. Growers of this excellent crop seem to feel that the cost per acre for growing is not as great in comparison to the returns as is the cost of producing other farm crops. Oh, yes, there are alfalfa failures, but then other farm crops do not always produce bumper yields. And then, when a good field of Grimm alfalfa does become firmly established, Oh, man!

CORNELL FIELD DAYS

H. H. LYON, NEW YORK

WHEN Cornell inaugurated Farmers' Week some ten or a dozen years ago, it was an experiment, but it worked. Again when Field Days were instituted at the College last year that was another experiment, but that worked also. Seven thousand were counted on the three days of last June's events. This year a better start was made on the first morning than was the case last year.

Auto tours at frequent intervals, commencing in the morning, to inspect the 13,000 acres of the University farm, were important features. An itinerary with ten stops was well planned in advance. At ten o'clock special features commenced in almost all lines and continued until nearly five.

⚜

The College farm has now sixty acres of corn, 60 of oats, considerable wheat, and 135 acres in hay crop. The cut of hay is expected to be 500 tons. The soil is a rather heavy loam to a stiff clay. Various rotations are followed depending on soil and needs of the farm. A rather long rotation has been followed, sometimes consisting of corn, corn, oats, wheat, and clover. In other cases a two-year rotation of corn and clover has been followed. In this no manure or other direct fertilizer was used, the second growth clover being depended upon to supply nitrogen and humus. Lime was used. This is a somewhat novel method and I doubt if it is likely to be advocated. It is simply possible where conditions demand it. A long-er rotation and the use of stable manure is now followed since a supply of manure is available.

The timothy plant breeding plots are of special interest to New York State farmers. Some varieties of timothy indicate possibilities so far in advance of others as to be almost beyond comparison. Parts of the state are interested in potatoes and 160 supposed varieties are being tested out. It is found that many varieties are simply duplications. There are found to be eleven types. An experiment has been carried out to determine the effect of suckers on the corn plant. Well, the removal of suckers results in lower yields and a poor crop. Sometimes nature knows her own job and we may in time find out why she does many seemingly foolish things. An item of comfort for the "tired" farmer with a garden is found in an experiment in which tomatoes yield four times as well if left to themselves as when staked up in the most approved fashion.

Cornell Holsteins are the progeny of one cow bought in 1887 by Professor Roberts. Good breeding has followed and particular attention to the selection of a dairy sire. A particularly good herd is the result and one cow, Glista Ernestine, has attracted world attention. She is twelve years old and is the only cow that has as many as seven records of seven days each of over thirty pounds. There are only three cows, say the authorities, that have as many as five records exceeding 30 lbs. This cow's highest record was 35.97 lbs. and the average of the seven is 33.16 lbs.

⚜

It would hardly be a visit to Cornell without a lecture by Dr. G. F. Warren. This time his topic was "The Price Outlook". The general price level is significant. Since 1791 it has been possible to plot curves which show this level. At that date it stood about 115. It went higher and by 1815, following our war of 1812, it shot up the highest known except for a time last year. From 1820 to 1860 its variation from 100 was not great but by 1865 it reached 210. The low points were particularly 1860 and 1896, the latter coming down to 60. In 1920 there was a showing of 270 for a brief period. Following the Civil war there was a drop in three months' time from 215 to 160, but in 12 months after the World War it went from 276 to 153. This last was the most violent ever known in our history. Already there is a slight recovery, but it has been a real panic. It will be fortunate if we meet no real crises during the next five months. These figures all refer to wholesale prices and retail prices might show even more startling conditions. The wholesale prices refer to about 250 commodities. In addition to the panic noted here there has been an agricultural panic on top of this.

The general price level on all commodities dropped to 153. This included agricultural commodities with the others. Agricultural commodities alone dropped to 107. It will be seen that all commodities except agricultural, if we separate them, would stand considerably above 153. That is what Dr. Warren means by an agricultural panic on top of the general panic.

A dollar is worth what it will buy except for the purpose of paying debts, says the professor. A bushel of corn, turned into money and used to buy commodities on the market, will purchase only 70 per cent as much as in 1909-14; horses 44 per cent; wool 59 per cent; butter 103 per cent. The average of agricultural productions brought 70 per cent as much as the pre-war level. It was only 66 per cent as much in May, therefore there is an encouraging outlook.

Speaking of freight rates the doctor advised that they should have advanced some time before they were and then about four months before they advanced they should have been lowered. We have been tardy in making all such changes. Now they will be reduced. It will be unwise to reduce the general level of prices to the pre-war level, but there is great need of an equitable adjustment of prices. Factory wages remain at 212, which is too high. Milk is at 103 which is too low. In general, agricultural prices are too low as compared with the things the farmer has to buy. His purchasing power has greatly decreased. He is not buying as liberally in the West as in the East because the western farmer's ability to buy is less than that of the eastern farmer. In either case it is not a buyers' strike, but just lack of ability to purchase the commodity wanted. Those things such as coal and some building materials will decline although the producers say they will not do so.

⚜

The speech-making during Field Days at the college was not in large supply. It was a time of looking at crops and talking with the professors and others. Hon. Fred Rasmussen of Pennsylvania spoke one afternoon. He holds that it is the business of agriculture to produce food and clothing, but in order to do this there must be profit in it comparable to others.

Marketing is as essential as production and to accomplish the best in this line requires ample statistics as to plantings, holdings, production, etc. Business has these pretty well in hand but farmers need them that are most up-to-date. Market reports should be had by telegraph and telephone. Warehouses controlled by farmers are essential. We must not dump all on the market at one time and that frequently at the wrong time. Standardize and sell what is wanted and when called for. Then it will be necessary to establish credit facilities in order to carry surplus stock along until needed. Of the six points made by the speaker that of co-operation came last but may have been emphasized most. Ten years ago no farmer would have thought of surrendering his right to determining his own time and manner of selling. He is now coming to place all he produces in the hands of his organization and authorize it to make his sales. He is a part of the organization and each man wields an influence. Combined effort now is essential. For that there must be leadership of a high order. It is also now a time for economy, not only in spending but in the line of production.

⚜

Haying is well under way at the college farm, and the same condition on other farms tends to keep the public from attendance at the college, therefore the crowd is not so large as some thought it might be. It was an interested group, go where you would, and I must say that not the least interest was at the ball games.

Moving pictures were put on for a half hour each day. These may have been in a measure instructional, yet primarily for entertainment it would seem. If so, they were splendid examples of what moving pictures can do to entertain. One day the picture hour was given over to views in the Adirondacks where game of many varieties is being kept. Kind treatment makes them pets, even the bear and the deer, while the mink made himself much at home. Black foxes became tame and the raccoon searches the pockets of his keeper for bits of food hidden there.

⚜

The supervision of official testing of pure-bred cows has been with the animal husbandry department at the college for a considerable time. The records have been remarkably free from suspicion. There was a suspicion at the college in the case of the Cabanna tests that all was not right yet the method of fraud as now generally believed was not suspected. The suspicion was on the use of drugs. In a sense the atmosphere is clearer, but the clearing up of this particular case may be difficult. Cole said he did and he said he didn't. If he says it either way next time it will make small difference with the public.

Cow testing association work is now supervised from the college and is in charge of Mr. Tailby. He has some job to look after the whole state, particularly as to the supply of men for the various associations. The agitation that comes from the work of associations undoubtedly makes people think.

THREE GUERNSEYS FROM THREE STATES WHICH HAVE LATELY COMPLETED RECORDS OF UNUSUAL MERIT; FROM LEFT TO RIGHT, NELLA JAY OF PENCOYD, OWNED BY PENCOYD FARM, PENNSYLVANIA; DORA OF ALLEN FARMS, OWNED BY J. O. WINSTON, NEW YORK; SILVER GEM OF CEDAR HOME, OWNED BY W. D. JAMES, WISCONSIN

On January 30, 1921, another world's record for the Guernsey breed was completed, the honor going to Nella Jay of Pencoyd, with 16,325.6 pounds of milk and 810.63 pounds of butterfat in Class F. On December 8, 1912, Langwater Hope was declared the world's champion Guernsey heifer in Class F. So wonderful was her work, her record being 773.59 pounds of butterfat, that it took nearly eight years to produce a heifer that could defeat her. To Katherine's Trixie goes the credit of accomplishing this. On November 7, 1920, that heifer became the champion with 791.48 pounds of butterfat. Under test at the same time as Katherine's Trixie was Nella Jay of Pencoyd. The race between these two heifers was an exciting one, the latter finally winning out by 19.15 pounds of butterfat, and becoming the present world's champion Class F Guernsey heifer. This is the first time that a Guernsey heifer of that age has exceeded 800 pounds of butterfat.

Nella Jay of Pencoyd is out of a one time world's champion heifer and the fourth highest cow of the breed today, Nella Jay 4th. Her sire is Langwater Pencoyd, a double grandson of Imp. King of the May. Nella Jay of Pencoyd not only runs true to type in breeding, but she runs true to type in form, and looks every inch a champion producer.

Dora of Allen Farms has qualified for a place among the Class B leaders of the Advanced Register by producing 13,434.4 pounds of milk and 775.41 pounds of butterfat. She is the ninth daughter of King of Chilmark to qualify for the Advanced Register and the sixth daughter to qualify for a place among the class leaders. She replaces her half sister, Ina's Grace, in tenth place in Class B with a margin of only .37 pounds of butterfat.

Silver Gem of Cedar Home, the first cow to complete an Advanced Register record in the new herd recently assembled by W. D. James, has qualified for third place in Class BB of the Guernsey Advanced Register by producing in one year 14,410.2 pounds of milk and 677.10 pounds of butterfat

Dairying as a Vocation at Camp Grant

O. K. ZOLL, ILLINOIS

THE United States army school is now well on its second year, and while it is still in the experimental stage, those who are most intimately in touch with the results obtained and with the possibilities of the future of the school are most sanguine of the permanency of the venture.

While the opportunities offered in the army school for training in any one of a number of vocations and for procuring a comprehensive knowledge of social, economic, and civic relationships have been presented by means of billboards and space advertising in newspapers and magazines, there are many people who are not aware of the scope of the work being done. The enlisted strength of the army is nearly two hundred thousand and 25 per cent of these men were enrolled in the army schools.

A state university enrolling 3,000 students is considered a large institution, yet the enrollment in the army school is equal to that of ten great universities. Should the present policy be continued it is certain that the number of students would be greatly increased next year, for over 70% of the new recruits state that they came into the army for educational advantages.

One of the most attractive vocations offered at Camp Grant Illinois, is that of dairying. Bordering the camp on the east is the camp farm of 700 acres. It is divided into two unequal parts by a concrete highway running directly north to Rockford, some five miles distant. The two dairy barns belong to the set of buildings on the east side of the road; they occupy a natural elevation that insures thorough drainage. The barns were on the farm at the time of purchase by the government, but have been remodelled and equipped with all necessary appliances for a model dairy. The stanchions are of steel, and the floors of concrete, brick, and cork. Water is supplied through automatic drinking cups. Especial attention has been given to light and ventilation. The manure is removed by a carrier and is spread on the fields daily.

At present there are twenty-five milking cows representing three breeds; viz. 8 pure-bred and 9 grade Holsteins, 4 pure-bred Jerseys, and 4 pure-bred Guernseys. For each breed there is a pure-bred bull. The beef cattle are represented by 3 Shorthorn cows and a bull.

The extension of the course of study now offered contemplates using the 9 grade Holstein cows as a part of the equipment of an 80-acre farm which two soldier students will operate on a thoroughly practical basis during their final year of study.

The course for the first year is of a very practical nature. It consists of a series of jobs, each continuing for about a week and the five job-weeks rotating throughout the year. During the first week the student cleans the stables and the cows; at the beginning of the second week he starts milking and continues the work of the first week; the third week he begins feeding and continues milking; the fourth week finds him in the bottling house where he cools the milk, sterilizes the bottles with live steam, bottles the milk and gets it ready for shipment; the fifth week is given to keeping records of the feed consumption and milk production of each cow, quantity of milk shipped, receipts from sale of milk, and such other data as a dairyman should have at his command.

The development of courses of study beyond the first year will depend upon the needs of the men who elect dairying as a vocation. It is the hope of the dean of the agricultural school to provide courses of study that will equip a man enlisted for three years so that he will be capable of holding a position of responsibility on a dairy farm or with the manufacturers and distributors of dairy products.

THE DAIRY HERD AT CAMP GRANT

Soiling Fifty Years Ago

HOARD'S DAIRYMAN:—Your recent article on soiling crops inspires me to tell of my experience in that line 50 years ago, when silos were unheard of. We then kept 18 cows, 1 bull, and 3 horses on 13 acres from the first of June until fall. Our first feed was about 1½ acres of rye or wheat, then oats, and then clover which was cut twice. We grew wheat for our own use and this land was plowed after harvest and planted to corn about July 4th. The corn gave us good growth for fall feeds.

Our feeding schedule started directly after milking when the cows were turned into an acre and a half lot where they had plenty of shade and water. At dinner they were put in the barn and fed again and were again turned out for the afternoon. They were again fed in the barn at supper time. We cut three feeds at a time each morning. One of us did the mowing by hand and the other put the feed on the wagon which took us about two hours. In mowing wheat or rye when green, there would always come a fair growth afterwards to plow down and by topdressing with manure one is quite sure of a pretty good crop. By the use of a horse drawn mower and hay loader the work could be considerably lessened today. It would be work, however, but what does not mean work for the farmer who really farms it?

Mantua, Ohio. W. A. L.

To Weatherproof Your Buildings

A building that is worth erecting is worth being made thoroughly weatherproof.

When you roof with Ruberoid Roll-roofing you are *sure*, that, year after year, it will give you perfect protection from every weather condition. Excessive heat or cold, driving rain, sleet or snow—Ruberoid Roll-roofing is proof against all these.

The extreme care devoted to the selection of raw materials and to every detail of manufacture enables Ruberoid to give you service-plus. Many Ruberoid Roofs, laid over a quarter century ago, are still intact, with the extent of their endurance yet to be determined.

When you are in the market you will find in Ruberoid a roofing which will give you full protection for years to come—which, although its first cost may be a trifle greater, will more than pay for itself in actual service. *Buy Ruberoid Roll-roofing.*

Make Manure Go Twice As Far

Manure is not a balanced fertilizer. Its big lack is phosphorus. To get a proportionate phosphorus content, three times the amount of manure must be used. The reason for this is that animals take from their food much more of the phosphorus than the nitrogen or potassium.

Four Leaf Phosphate added to manure will supply the deficient phosphorus, make a balanced fertilizer, and extend the same amount of manure over twice the area. Use Four Leaf Phosphate to reinforce manure. The results will be better and bigger crops. Write us for prices and freight rates.

Buy A Virginia Farm Now Now is the time to buy a farm in Virginia. Prices are reasonable. You can grow fine crops of corn—all grain and grass crops. Types of soil especially adapted to fruit growing. Opportunities for dairying unexcelled. Virginia offers more advantages to the farmer than any other State—variety of soil, mild winters, long growing season. Why farm where you can grow only two or three crops and be far away from good markets, when you can grow a variety of crops in Virginia and be near the great consuming markets? The healthiest climate in America, free from disastrous storms. Write now for Hand Book, maps, etc. G. W. Koiner, Commissioner of Agriculture, Richmond, Va.

EDITORIAL COMMENT

THE Pennsylvania legislature enacted a law at its last session which forbids the use of pictures of dairy cows, the names of dairy cattle, or butter names in advertisements of oleomargarine. Since the introduction of oleomargarine dairy terms have been used for the purpose of securing the attention and good will of consumers. Oleomargarine has had a most difficult time to stand upon its own feet and sell to the consumer upon its own merits. It has sought the cow and her product as an aid and the consumer has been deceived because of this practice. We commend the legislature of Pennsylvania and recommend that other states enact similar laws.

THE producers of raw materials are first to suffer in the decline of prices, then follows the manufacturers and wholesalers, and last the retailers. This explains why the wholesale price of cheese has been as low as 12 cents a pound but still retails at from 30 to 35 cents. This is too wide a spread and is preventing a larger consumption of this splendid food. It is just a bit tantalizing to find the farmer's product selling below pre-war prices with the retail price at near war prices.

If grocers can find no way of reducing their prices for cheese perhaps a consumers' retail cooperative association could be started; this might help them to find a way to reduce the price of cheese to the consumer.

SEVERAL samples of sweet cream butter, after being in cold storage for more than a year, averaged in score 93.47 and above the highest scoring butter quoted in New York. These samples represented 1,000,000 lbs. of navy butter packed under the supervision of the Dairy Division.

For several years the Dairy Division has been a strong advocate of sweet cream butter and one of the main reasons for favoring sweet cream butter is its splendid keeping qualities. It is not unusual to have sweet cream butter score higher after it is held in cold storage for a few months than when it was made. For storage purposes sweet cream butter is far superior to butter made from ripened cream.

We also believe for immediate use the market would, to the advantage of the dairy industry, consume a larger quantity. The sweet cream butter market may well be closely considered by creameries in position to manufacture it.

THE ADJUSTMENT PERIOD

According to reports of the Department of Labor, farm products have declined 52 per cent from the peak price in May, 1920, and are 17 per cent above the 1913 price level. Food has declined 54 per cent, but is still 33 per cent above the 1913 level. Clothing has declined 40 per cent and is still 81 per cent above the 1913 level. Building material has declined 40½ per cent, but is still 102% above the 1913 level. All commodities considered together have declined 44½ per cent, but are 51 per cent above the 1913 level.

These figures show that the farmer's products have been liquidated more than others, due to the fact that as a producer of raw material he is not in position to protect his product as are those engaged in manufacturing or distribution. The figures show that we are making progress in our readjustment, but it will take some time yet before the proper relationship is established between all commodities.

No one likes this period or the out-of-proportion relationship in the prices of various commodities but we do not know how this readjustment period could have been avoided. If the farmers had been better organized so that they could have marketed a larger percentage of their products co-operatively, they could have undoubtedly prevented their products from being liquidated to the extent that they have been, just as the wholesaler and retailer have been protecting themselves, but no combination of forces will prevent the liquidating of all commodities. Proper organization for marketing the farmers' products co-operatively would have extended the period and would have prevented the sudden and severe decline in their commodities. This period had to take place, so let us go through it as cheerfully and optimistically as we can, buying what we need to carry on our business in the proper way.

ONE VALUE OF ORGANIZATION

An organization of milk producers not only gives opportunity for its members to market their products to best advantage but it has many other factors of importance to their welfare. It is of advantage to the milk producers to come in contact with a reflex action of the market; it teaches them better methods of handling their milk, and they learn through the complaints and losses which are produced by the improper handling of their product.

The June Twin City Milk Producers' Bulletin states in substance: "Our Sanitation Department is making about 6,000 sediment and acidity tests each month. Wonderful improvement has been made in the production of sanitary milk and there is less trouble with milk souring." The necessity of thoroughly cooling the milk both night and morning in order that it may reach the market in good condition is pointed out by the producers' association.

If these producers were not marketing their own product they would not give as close attention to complaints about sediment in their milk or the condition of its acidity. Frequently have producers held that distributors complained of the quality of milk in times of surplus. It is undoubtedly true that the distributor is more particular about his milk when he has an abundance than during a period of shortage. On the other hand, there is no question but that many milk producers are careless and indifferent in the handling of their milk and they need to understand that tremendous losses are sustained every year from such carelessness.

This bulletin also states that "The amount of milk lost each year in souring, in the Twin Cities, would put a good cooling tank on the farm of every member of the organization." Milk producers cannot afford to sustain such loss by producing milk which sours in the hands of the consumer. Such milk does not encourage larger consumption of milk, as the consumer does not take kindly to sour milk. It is therefore of large advantage to the milk producers to sell their milk collectively for it not only places them in position for securing full market price for it but it gives them an opportunity to educate themselves as to the proper way to produce market milk and the penalties suffered if they do not. It is to the advantage of the members to have the information which comes to them direct from the market.

MILK PRICES

The Interstate Milk Producers' Association has found that in marketing milk for its members certain well defined laws in determining prices can not be set aside or overcome. The Milk Producers' Review in commenting upon the prices for which it sold the members' milk for the month of May, says: "The dairy farmer was paid all that was possible for his product in view of supply and demand and in conformity with fair competition." Many farmers feel that through organization it would be possible for them to fix arbitrarily the price for which to sell their products. The fact that the consumer must be considered must never be overlooked. If any particular product becomes too high, the consumer will stop buying it or will limit his purchase. It only requires a small quantity of any product to depress its market price materialy. The consumer holds the whip-hand in the regulation of prices, notwithstanding food is a necessity. In other words, the price which the consumer pays for commodities depends to a very large extent upon his income.

There is another factor to consider in determining the prices of foods. Before the war it was estimated that we wasted one-half of the food produced. Food has been our cheapest commodity and we have shamefully wasted it. As it becomes higher in price the consumer will not be so wasteful and as a result there will be a sufficient surplus under our present agricultural development to bring the price of food down to a level that the consumer is willing and can meet. In this way, the prices of food products are made. The advantage of organizing is that the producer will be able to market his products more efficiently and will secure the price that the consumer is willing to pay for them.

THE HOLSTEIN COW NEEDS WISER FRIENDS

In our report of the proceedings of the annual meeting of the Holstein-Friesian Association of America we did not hesitate to express our opinion of the method used in handling the proxy votes and the bad effect such work has upon the advancement of a great breed of cattle. Over 7,000 proxies were in the hands of four men, F. M. Peasley, A. L. Brockway, C. N. Newman, and J. S. Brill, and the use that they made of these proxies has put the association in a very bad position.

These four men who held over 7,000 proxies voted to table the J. M. Hackney resolution which we publish again that the reader may know its contents. It is as follows:

"The Holstein-Friesian Association of America has because of the black and white cow become the strongest and largest organization of its kind in the world. We recognize the foresight and courage of the founders of this great organization, many of whom are living and with us today. The influence of this great organization is world wide. Through good management in the handling of the black and white cow it has become practically the dairy industry of the United States. We are passing through a period of readjustment due to the world war. Wisdom must be our watchword. Any mistake we make now will take a long time to overcome. Under the guidance, wisdom, and management of President Aitken, our present officials, and board of directors, we have made a remarkable progress. We regret the unfortunate situation known as the Cole-Cabana controversy and the litigation in connection therewith. We commend the vigorous action of those officers and directors who have fought to preserve the integrity of our records and we urge that this most important matter be carried to a successful conclusion, realizing that the preservation and integrity of the records made by the black and white cow are the basis of the industry."

To us there are but two conclusions which can be drawn from the action of these four men voting to table this resolution. First, their personal bitterness was so great against President Aitken, or the officers, or the board, or all of them, that they would not approve the resolution; or, second, that they objected to carrying the Cole-Cabana case to a "successful conclusion". If their personal prejudices prevented them from voting for this resolution, which recognized that remarkable progress of their association had been made under President Aitken and the present officials, they have shown themselves to be too small to be entrusted with anyone's proxy. If their voting was to keep the Cole-Cabana case from being carried to a "successful conclusion" then they show that they are unworthy of handling anyone's proxy.

Would the breeders whose votes were used for this purpose continue to have fastened upon their association the Cole-Cabana scandal? Their proxy representatives cried out at Syracuse: "The board of directors was illegally elected." This is camouflage, for the sixteen directors of the associa-

tion, whether legally or illegally elected, are fully capable of rendering justice to any member in the association who seeks and desires justice.

It matters not so far as the public opinion is concerned, whether the Cole-Cabana affair is ever brought to "a successful conclusion", but for the honor of the Holstein cow and her association it must be "carried to a successful conclusion".

Square Silo

Will you please be kind enough to give me information in regard to a square silo. I want to build a silo 24 feet square with four compartments, making four silos of 12 feet square, each boarded on the inside and outside. I never saw a square silo and don't understand why they are all round.

St. Louis, Mo. B. C.

We would not advise the building of a square silo because the round silo can be built more cheaply as it will take less lumber per cubic foot capacity and because lighter material may be used in construction. In addition to the cheapness in cost, the square silo does not give as good satisfaction in the preservation of silage. This is due to the fact that there is a greater surface of wall for a given content of silage, but more particularly to the fact that the silage does not settle as evenly in such a silo. This is particularly true of the corners where considerable spoilage will take place.

Stover Silage Experience

HOARD'S DAIRYMAN:—I have seen several letters in regard to moldy silage and the making of stover silage. We have had both normal corn silage and corn stover silage the past year and have had no trouble with mold with either crop. We use a combined silo filler and husker which has attached to it a rotary pump with a regulating valve so that it will deliver any amount of water up to a one-inch stream. In making our stover silage, we connected to a three-quarter-inch pipe in the stable and had a hose that delivered the water to the top of the distributor pipe. In this way we lost no water and when it came in contact with the force of the blower it wet all the stalks and was evenly distributed throughout the cut material.

With this machine we husked the corn, cut the stalks, and wet the silage all at one operation. We paid less for help than we would have paid had the corn been husked in the field. We fed the stover silage to young stock that ate it with relish and it went much farther than the dry stalks. These cattle came out in the spring in good shape. We also run a small stream of water when making the normal corn silage from the ears and stalks which helps it to pack much better.

By having our outfit we get more silage, it keeps perfectly, and we never had sweeter silage.

Sparta, Mich. C. B.

Most Economical Barn

I desire to build a dairy barn large enough to house about 18 cows. Which would be most economical, a round or rectangular barn? I want to construct it as near fire proof as will be possible with limited means. Which would be cheaper, concrete for walls or tile blocks?

Eldorado, Ill. E. M. G.

Despite the contention that a round barn will house more cubic feet at less expense than a rectangular barn, comparatively few dairymen have been sufficiently impressed with this idea to cause them to attempt this system of building. While we know of many men who have found the round barn highly satisfactory, yet, taken all in all, we apprehend that under the usual conditions the rectangular barn, 34 to 36 feet wide and of sufficient length to accommodate the herd, will be found most convenient and most economical.

It is scarcely practical on most farms to attempt to build a barn wholly of monolithic or solid concrete. This is due to the difficulty of securing adequate forms for such a purpose, or the engagement of contractors who are skilled in this type of work. The next best recourse is the use of hollow tile or possibly concrete blocks if these latter are available. In a general way, solid concrete will be found suitable for the walls of the stable basement but not for the super-structure.

We would suggest that before building every farmer should get in touch with several of the barn equipment companies who advertise in our columns. These concerns employ special architects who will be able to give very considerable assistance. They will be pleased to give general information free of charge but if special plans and specifications are desired, and we believe they are always desirable, they will make a moderate charge for these. An inquiry addressed to one of these concerns places a person under no obligation to buy their particular type of equipment.

Division of Labor on Dairy Farm

I am operating two adjoining farms of 300 acres as one farm. On one of these I keep 40 cows and on the other 7 horses and the young stock. The buildings are 2,500 feet apart. The men on the horse and young stock farm must come down at milking time and help with the work. This causes a good deal of dissatisfaction and interferes with the general farm work. The men at the 40-cow farm frequently help on general farm work. The two farms are worked as one with about 220 acres tillable and 80 acres of meadow and woodland. There are at present three men on each farm.

Will readers of Hoard's Dairyman who have had experience suggest a plan to work this farm so that one set of men attend to the dairy and the other to the barn work? How many men are necessary to milk and care for 40 cows? Some western idea may help to solve the problems of a farmer who wants peace and harmony on the farm together with the greatest efficiency.

Pennsylvania Dairy Farmer.

Readers of Hoard's Dairyman are requested to answer this appeal for advice.

In the West it is customary to have one man milk, feed, and take entire care of 20 to 30 cows a day. It would not seem too exacting, on the average dairy farm, to expect two men to take care of 40 cows and do all the barn work, as well as probably help out occasionally in the general farm work when the barn work is at a minimum.

Making Casein

Can I extract the casein of milk in soluble condition? Is there any book on this subject, or else are there any books on milk powder which may give some points on soluble casein?

Pittsburg, Pa. H. D. S.

By extracting the casein of milk in *soluble* condition I presume you mean in that condition in which it is present in normal milk so that when it is again mixed with a sufficient amount of water it will return into a liquid similar to milk.

The casein in normal milk is present in what is called a colloid condition. It is not actually in solution nor is it precipitated visibly. It is present in a condition which lies between a solution and a solid and in this condition it is held in suspension in the milk and forms, with the other components of milk, a complete emulsion. Nor is the milk casein present in normal milk in pure form. It is in chemical combination with several of the mineral constituents of the milk, chiefly the calcium and the magnesium.

If it is not desired to remove these mineral constituents from the casein; that is, if it isn't desired to produce chemically pure casein, it is possible to separate the casein from the milk by filtering the milk through a filter consisting of unglazed earthenware. Or, the casein could be separated by dializing the milk causing the soluble constituents of the milk to escape and leave nothing but the calcium casein and water.

Neither of the above two processes is commercially practical. Both would be exceedingly slow and antiseptics would have to be added to the milk to prevent it from undergoing fermentation during the process, and neither process would yield casein that is free from such mineral constituents of milk as calcium and magnesium, which mineral constituents are not desired when casein is intended for industrial purposes.

A practical way to remove the casein from milk in pure condition and to have the ultimate product in soluble form, is to add an acid, such as lactic acid, acetic acid, sulphuric acid, or hydrochloric acid to the milk for the purpose of precipitating the casein. This produces what is called free casein. The free casein is insoluble in water, but it is pure. The calcium and magnesium with which it was associated in milk combine with the acid and therefore liberate the casein.

The detailed procedure of making the free casein or curd is as follows: Run the skimmilk into a wooden vat. Heat with live steam to about 130° F. Then add the acid. If sulphuric acid is used, dilute one pint of crude sulphuric acid with seven pints of water and add to each 1000 lbs. of skimmilk. Distribute this acid over the entire vat when adding, stir the skimmilk thoroughly until curdled, then drain off the whey, using a strainer covered with cheese cloth so as to retain any fine particles and prevent their loss. Now rinse the curd with cold water. This can be conveniently done by turning a hose on it. Press this washed curd and grind it, using a peg mill similar to the cheese curd mill. This curd represents the free casein and is ready to be converted into soluble casein, or if desired, it may be dried before making it soluble.

This free casein is insoluble in water but can be converted into soluble casein by treating the wet curd or the partly dried casein with an alkali, such as caustic soda, caustic potash, ammonia, lime water or baryta water, or in an alkali salt such as sodium carbonate or potassium carbonate, and evaporating the solution at moderate temperature, or drying the casein solution by any one of the processes used for making milk powder, such as the film (roller) process or the spray drying process as explained in detail in "Condensed Milk and Milk Powder".

The casein can also be precipitated and recovered from the milk by certain ferments such as rennet. But this rennet casein is not a pure casein. Its precipitation is not the result of a chemical separation of the mineral constituents of casein, it is a fission product, from which it is difficult to remove the mineral salts. The rennet casein, or paracasein as it is generally called, is not soluble in water unless previously treated with an alkali.

One of the undesirable impurities in casein intended for industrial purposes is its butterfat content. While casein is never made from whole milk, but always from skimmilk or buttermilk, there is always some butterfat present in these milks. Commercial skimmilk generally contains about .1 to .2 per cent butterfat. Casein made from skimmilk testing .2 per cent fat may contain from 2 to 4 per cent of fat. If it is desired to have a fat-free casein, the curd precipitated from the skimmilk by acid is freed from its fat by extraction with fat solvents or by dissolving the curd in alkalies and then reprecipitating it by acid and washing the reprecipitated curd. Several repetitions of this solution and precipitation are required to rid the casein completely of the fat. Another method recommended for producing fat-free casein is to mix the skimmilk with alkali (to 100 gallons of skimmilk add 2 to 4 lbs. of caustic soda), warm the mixture to about 110° F. and run through a centrifugal separator until all fat is removed. Next precipitate the casein with diluted sulphuric acid and proceed in the usual way. This last method is patented.

It should be understood that the soluble casein is rarely prepared in dairies. The casein companies that purchase casein for industrial purposes prefer to secure this casein in the insoluble form and before any alkali is added to it. The rendering soluble of the casein by chemicals is a part of their work in the manufacture of the various industrial casein products.

One of the most valuable books on casein is that entitled "Casein, Its Preparation and Technical Utilization", by Robert Scherer, translated from the German by Charles Salter. This book is published by D. Van Nostrand Co., New York City.

Illinois. O. F. HUNZIKER.

Hogs on Shares

A bought five pure-bred Poland sows upon B's offer to take them to his place and raise the pigs, giving A one-half of the pigs and the sows back. No time was set as to when A was to get the pigs. B was to get market price for all over the original weight of the sows if they were fattened for market. A was to keep records, attend to the advertising, and assist B in every way possible to dispose of the pigs. B has a feeling that it was not a fair bargain. Both A and B wish to deal fairly in the matter.

Will you kindly state what both A and B should have and when?

Charles City, Ia. E. M. S.

The usual arrangement where hogs are placed on shares is for the owner to deliver them when safe in pig. The man who takes them will raise the young pigs to weaning time, when the increase is divided and the original hogs or their equivalent are returned to the owner. If a sow has been lost, one of the sow pigs is substituted before the division is made. The owner receives back his original sows (or a number equivalent to them) and one-half of the pigs at weaning time.

In case the pigs or sows are kept beyond the weaning time, the feeder should have some additional allowance for this in the shape of reimbursement for the feed given and the labor expended on the owner's half share of the pigs.

This arrangement for hogs on shares will be varied, of course, to meet the particular circumstances that may arise, but doubtless an agreement based on that given above will prove most satisfactory.

Subscription Rates

Subscription in United States and Mexico $1.00 per year; 3 years, $2.00; Canada, $1.50 per year.

FOREIGN SUBSCRIPTIONS may be sent through news dealers and book sellers in all foreign countries.

All foreign countries in the Postal Union $2.50 a year; not in the Postal Union $3.00, including postage.

Correspondents must not expect us to acknowledge the receipt of letters containing remittance for subscription. The receipt of Hoard's Dairyman is sufficient notification that money has been received. The label on the paper will show date to which subscription is paid. In case of renewals, if date on label is not changed within two weeks after remittance is sent, inform us at once.

We solicit advertisements of meritorious articles needed by the farmer. We try to keep our advertising columns clean and wholesome, that they may merit the patronage and confidence of our readers. Unwholesome, immoral, and quack medical advertising are excluded. A sincere effort is made to exclude frauds, irresponsible and unscrupulous firms. We will always take it as a favor to be notified whenever any advertiser's dealings with a subscriber are in bad faith or evidence a lack of business honor. Advertisers generally recognize the readers of Hoard's Dairyman as an up-to-date class of farmers, who farm with business-like methods, and we hold our columns for the patronage of only those with whom our readers can deal with profit and satisfaction.

ADVERTISING COPY must be received eight days previous to the date of publication. Advertising to be classified or changes in advertising must reach us twelve days previous to date of publication.

Entered at Fort Atkinson, Wis., as second class matter.

Coming Events

Sept. 26-Oct. 2nd—Dairy Cattle Congress at Waterloo, Iowa.

Oct. 8-15—National Dairy Show at Minnesota State Fair Grounds. Manager, W. E. Skinner, 910 So. Michigan Ave., Chicago.

Oct. 31 to November 5. Association of Ice Cream Supply Men, Buffalo, N. Y. Roberts Everett, 1328 Broadway, New York City, Secretary.

Ice cream is rapidly climbing out of the luxury class and taking its rightful place among the palatable and highly nutritious foods.

Artificial shade in the pastures, if nature has furnished none, will pay well in increased thrift of the live stock.

E. B. Heaton Heads Bureau Dairy Department

E. B. Heaton has been appointed director of the Dairy Marketing Department of the American Farm Bureau Federation. Mr. Heaton is already a member of the Farm Bureau staff and has done effective work for the Department of Organization. Previous to his employment by the Federation he was farm adviser in Du Page County, Illinois, where he originated the slogan: "Make the farm feed the cow." Mr. Heaton has given a lifetime of intensive study to the problems of the dairy farmer. As head of the Farm Bureau Dairy Marketing Department, Mr. Heaton will devote his activities to the co-operative distribution of dairy products, to the development of organizations in unorganized territory, to advertising, standardization, and grading of dairy products, to studying existing co-operative dairy marketing organizations, and to assisting in every way possible the work of the Farmers' Milk Marketing Committee of 11. Interviewed concerning his new work, Mr. Heaton said:

E. B. HEATON

"The big job is to build up dairy marketing organizations. It is easy to formulate co-operative marketing plans and to enlist the support of the leaders in the various communities; the difficult task is to secure the active support of the majority of the milk-stool farmers. This applies to the whole United States.

"The work of the Dairy Marketing Department will be largely governed by the recommendation and plans formulated by the Committee of 11. It would seem that the formulating of national policies in regard to the marketing of dairy products can be worked out in a national way along a few definite lines. It will not be possible to cover all of the dairy marketing problems because the marketing of raw or market milk is one that is governed largely by local conditions. It should not be difficult to carry out a definite line of marketing butter and cheese and to carry out a national policy of advertising, standardizing, and grading of dairy products. If this is done in an effective way, it should be possible to take care of the unorganized territory."

World's Dairy Congress

Dean H. E. Van Norman of the College of Agriculture, University of California, has been granted a leave of absence to organize a World's Dairy Congress in the United States.

It will be recalled that at a preliminary meeting of the national dairy interests during the last National Dairy Show, the U. S. Department of Agriculture was requested to take up with the Department of State the necessary steps to secure from Congress authority for the President of the United States to invite the participation of all nations in a World's Dairy Congress in this country. Such authority was granted by the last Congress, and, upon request of former Chief Rawl, Dean Van Norman took up the preliminary work of perfecting an organization which will represent all branches of the industry for the development of the Congress.

Mr. Van Norman's Chicago address is Room 222, 910 South Michigan Avenue. His temporary Washington address will be care of C. W. Larson, Chief, Dairy Division, U. S. Department of Agriculture, Washington, D. C.

Wendt With Michigan State Department

H. D. Wendt, secretary of the Michigan Allied Dairy Association, has been appointed acting director of the Bureau of Dairying of the new State Department of Agriculture in Michigan. Mr. Wendt was born on a dairy farm in Southern Minnesota; he acquired the equivalent of a high school education and took a short course in dairy manufactures at the Iowa State College. He managed and operated creameries in Iowa for several years; and was for a time connected with Purdue University, Indiana, in the capacity of dairy field agent; and also supervised the manufacture and packing of butter for the United States Navy Department for several seasons. To Mr. Wendt goes the credit for organizing and effecting the unity of purposes existing in the dairy industry in Michigan. No other state in the Union has such a complete dairy organization as that of the Michigan Allied Dairy Association which embraces all phases of dairying in the state. Mr. Wendt became connected with the State Dairy and Food Department in Michigan in 1913 and in 1917 was appointed chief of the Dairy Division of that department.

Two Days at Marshfield

Two big days are scheduled for Central Wisconsin farmers at the experiment station at Marshfield, Wis., on July 20 and 21. Judging from the attendance in the past, farmers are appreciating the services of the Marshfield substation and are putting into practice many of the ideas advocated by the men in charge of the different lines of work.

The first farmers' meeting was held eight years ago when a one-day session was held, attracting from 75 to 100 farmers. The popularity of these meetings has been such that several day sessions are necessary now in order to do justice to the program carried out. The past year upward of two thousand farmers visited the station during the three-day session. This year Taylor and Clark Counties, in charge of R. A. Kolb and H. M. Knipfel, county agents, are planning a big excursion the first day, July 20. The second day is given over to Marathon and Wood Counties in charge of county agents.

Horses in Hot Weather

1. Load lightly, and drive slowly.
2. Stop in the shade if possible.
3. A sponge on top of the head, or even a cloth, is good if kept wet. If dry it is worse than nothing.
4. Water your horse as often as possible. So long as a horse is working, water *in small quantities* will not hurt him. But let him drink only a few swallows if he is going to stand still.
5. When he comes in after work, sponge off the harness marks and sweat, his eyes, his nose and mouth, and the dock. Wash his feet but *not* his legs.
6. If the thermometer is 75 degrees or higher, wipe him all over with a *damp* sponge, using vinegar water if possible. Do *not* wash the horse at night.
7. Saturday night, give a bran mash lukewarm; and add a tablespoonful of saltpetre.
8. Watch your horse. If he stops sweating suddenly, or if he breathes short and quick, or if his ears droop, or if he stands with his legs braced sideways, he is in danger of a heat or sun stroke and needs attention at once.
9. If the horse is overcome by heat, get him into the shade, remove harness and bridle, wash out his mouth, sponge him all over, shower his legs, and give him two ounces of aromatic spirits of ammonia, or two ounces of sweet spirits of nitre, in a pint of water; or give him a pint of coffee warm. Cool his head at once, using cold water, or, if necessary, chopped ice, wrapped in a cloth.
10. If the horse is off his feed, try him with two quarts of oats mixed with bran, and a little water; and add a little salt or sugar. Or give him oat meal gruel or barley water to drink.
11. Clean your horse *at night*, so that he can rest well, and clean him *thoroughly*. The salt dandruff drying on his skin makes him uncomfortable, and often produces sores under the harness.
12. Do not fail to water him at night *after* he has eaten his hay. If you don't he will be thirsty all night.
13. If it is so hot that the horse sweats in the stable at night, *tie him outside*, with bedding under him. Unless he cools off during the night, he cannot well stand the next day's heat.
—Boston Horse Association.

Pure-bred Cattle in Mississippi

According to the 14th census, Mississippi has 8,367 pure-bred dairy cattle, of which number 6,229 are females. The number of pure-breds by breeds are as follows: 101 Guernseys, 1,331 Holsteins, 6,571 Jerseys, and 364 other breeds.

W. G. ROGAN

W. G. Rogan was recently appointed to succeed F. G. Swoboda as agricultural agent for Marathon County, Wisconsin. Mr. Swoboda has accepted the position of manager of the Wisconsin Cheese Producers' Federation which is steadily increasing its range of activities.

Washington, D. C., Weekly News

[SPECIAL TO HOARD'S DAIRYMAN]

WASHINGTON, JULY 5—What is "garbage oil", and what are its chief uses? Persons who know anything about the manufacture of this competitor of cocoanut and other vegetable oils will confer a real favor if they will give some information about it to Chairman Fordney of the Ways and Means Committee of the House. Chairman Fordney says that he has been told that this oil is being made in large quantities, used especially in soap making, but incidentally can be used wherever the so-called "edible" oils are used. He wants to know if it is being used in food products. Who knows; who will tell?

⚜

Chairman Fordney is taking unusual interest in this whole subject of vegetable and other oils which are crowding into the field properly occupied by butter. He told Hoard's Dairyman's representative that he wanted to put a much larger duty on cocoanut oil than finally was named in the tariff bill, because he found it was being used in large quantities in making imitation dairy products. He says that it could not be done because it was shown that a higher duty would increase the cost of soap to every household in the country.

His decision when confronted by this alleged fact was that since the dairy industry could not get adequate protection by a tariff, he would do what he could to remedy it in a revenue bill, and so he introduced on Friday, June 30, the filled milk tax bill, which has been asked for specifically by Wisconsin farm and dairy interests, and generally by all dairy interests. This bill covers the whole problem of the manufacture and sale of filled milk by imposing manufacturers' and vendors' license taxes, placing a flat tax of three and a half cents per pound on the product itself, and providing for strict posting of signs to warn the public of the places where it is sold as an imitation of real milk.

⚜

The Fordney Filled milk bill was referred directly to the Ways and Means Committee which means that it will get consideration while the other revenue bills are under study, and that will be in the near future. Chairman Fordney asked the Hoard's Dairyman correspondent to say he needed the assistance of the dairy industry in securing the facts relative to the amount of this commodity which is being made and offered for sale, the methods used to put it off on the public in place of milk, and the other pertinent facts. "I know the situation myself" he said, and the fact that he introduced the bill and is back of it is proof of this, "but I must convince my colleagues and the country."

The bill is similar to the Beck bill already before the Ways and Means Committee but more complete and carrying a heavier rate of taxation. Congressman Nelson of Wisconsin was also anxious to introduce a similar bill, but withdrew in favor of permitting the chairman of the committee to introduce it.

The tax rate provided for manufacturers is $1,500 a year, for wholesalers half that amount, and for retailers $12 a year, just enough to compel registration and supervision by the revenue officers. The tax rate on the commodity itself is fixed in the bill as introduced at three and a half cents a pound.

Chairman Fordney is also interested in the question as to whether or not oleomargarine should not pay a bigger tax in this time of needed revenue and dangerous competition of cheap foreign oils with the American dairy industry. "It has been said," he is quoted as saying, "that oleomargarine is the poor man's butter, and that it ought not to be taxed at all."

Of course he knows now, as the public is rapidly coming to know, that oleomargarine is not butter at all, and contains the vital food elements, discovered and first explained to the public by Professor McCollum through Hoard's Dairyman, only in very limited quantities if at all and these chiefly from the small proportion of milk or cream mixed with it to make it a better counterfeit of butter by getting the milk taste in the oleomargarine. Not being butter at all and coming on the market as it does very largely made of cocoanut and other cheap foreign oils, in ruinous competition with the product of an essential American industry, there is a good reason for taxing it more at this time. Colored oleomargarine now pays ten cents a pound and still commands a market, although to be sure in very small amount. Still it has proven impossible to prevent the gift of color with white oleomargarine, so a very important feature of the oleo law is defeated, that is, the protection of the public which buys the oleo at table. Under all these circumstances, with lowered prices on the real butter and with colored oleo being sold carrying a ten-cent a pound tax, there are many members of the dairy industry who believe the time has come to make the tax rate even on all oleo, ten cents a pound, and add to the law a provision that color like butter either shall be sold or given away with the goods if especially taxed, or that a different color scheme be demanded, such as is being considered in other countries which are trying to protect and build up their dairy industry.

⚜

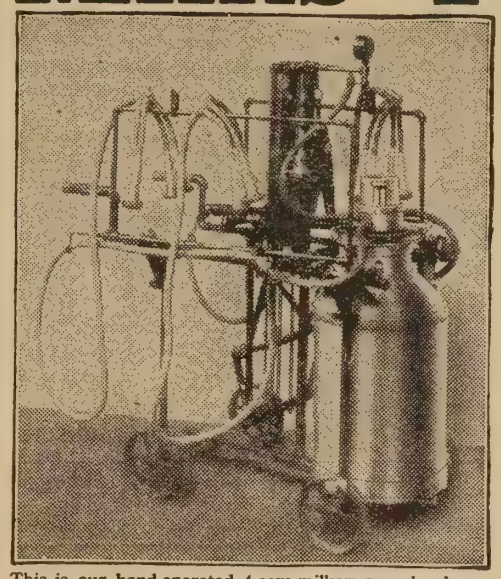
The House Committee on Agriculture is holding further hearings on the Voigt bill to make it unlawful to manufacture or sell filled milk, as agreed upon when the proponents of the bill were heard three weeks ago.

Professor Mendel of Yale and representatives of the makers of this product were called before the committee on July 6. The arguments against the bill are as to its legality, and claims that filled milk makes a market for skimmilk and is a perfectly pure, wholesome food product which can not be ruled as illegal.

⚜

The Fourth of July recess of Congress found no action taken on either Packer legislation, or the co-operative marketing bill. The tariff comes before the House on Thursday, July 7. The debate in the House is to be short. A few committee amendments may be proposed, but it is expected that the bill will go to the Senate about as reported out. Congressman Frear of Wisconsin will file a minority report, and make a hard fight to get the dye embargo and licensing system stricken out. He also opposes the tariff on lumber and on potash salts used for fertilizers.

⚜



The Executive Committee of the National Grange, in session here July 6 and 7, will take action on both filled milk and oleomargarine legislation. The committee is expected to endorse the Fordney filled milk bill enthusiastically, and to urge all state granges to support this measure.

Milks 4 Cows at Once

the Milking Machine Sensation of 1921

Costs Half; Does Double Work

(Twice the work of our 1920 model)

This is our hand-operated 4-cow milker; we also have a 2-cow milker ($123) on which we offer a free trial (exchangeable for 4-cow milkers), and gasoline engine and electric power milkers.

The *new* PAGE *4-cow* Milker—operated by hand—no gas engine—no electricity—one man milks 4 cows at once. Little work—quickly done—easiest of all machines to handle—easiest, by far, to clean; the most wonderful advance in milking machine manufacture.

We also have a 2 cow milker, only

$123!!

30 Days Free Trial!

In every locality in which we have no dealer, or agent or sales-manager, we will send *one* machine on 30 days' free trial and at our rock-bottom price, direct from the factory; to the first responsible farmer who asks for it. No deposit; no C. O. D. 30 days full free trial, you alone to decide. *ACT QUICK!*

After trial, if satisfactory keep the machine on our IRON CLAD Guarantee. If satisfactory, choose your terms. You can pay cash or half cash and

$7.50 a Month!

Yes, only $7.50 a month—easy payments to suit the farmers in these hard times—easy payments, yet the rock-bottom, direct price on the best of milking machines. Terms to suit without any down payment at $4.00 a week or $18.00 a month.

Costs Nothing to Install—Not a cent of installation expense—no engine, no motor, *nothing! Just* the machine for small herds. (If you want power, get our electric or engine power outfits at $225 and up.)

You milk right into your own ordinary milk can; no extra pails; no pipes; no pulsators; no tanks. Amazingly easy to clean.

Guaranteed to do the work.

Guaranteed to save time.

Guaranteed—the last word in sanitary milking (one creamery wrote us that the most sanitary milk came from farmers using the PAGE Milker).

And—

Guaranteed:

Action alterable to suit every cow separately. Instantly adapted to any cow according to her disposition and how easily or how hard she milks.

Book on Milking Sent Free!

This book is full of *important* information for the man who is thinking of getting any kind of a milking machine—**Get Posted!**

Burton Page Co., Dept. B462
661 West Lake Street, Chicago, Ill.

Please send me your free book on milking. Also description of your new model PAGE 4 cow Milker, and your engine and electric power models. Also details of your 30-day free trial offer on the 2 cow, hand operated model.

SPEED IN SILO FILLING

Extra large throat. Cutter head with four knives and six blade fan on same shaft. Unusual capacity. Three Sizes. Automatic Governor prevents Clogging.

ROSENTHAL SILO FILLER

Safe, strong, simple. Write for catalog and prices and a useful souvenir **FREE** State H. P. of engine.

Rosenthal Corn Husker Co.
Box 20 Milwaukee, Wis.
Also Corn Huskers and Shredders.

Hoosier WOOD SILO

Yellow Pine or Oregon Fir, with or without hinged doors. Best Anchoring system on the market. We can furnish one-piece staves in Pine up to 24 feet long, Fir up to 32 feet long. Prompt shipment from stock.

STEEL ROOFS, CHUTES AND PAINT

Complete line of steel roofs and chutes for silos. Paints for all kinds of farm buildings at money-saving prices direct from manufacturer to buyer. *Write for prices and special agents' proposition.*

HOOSIER SILO CO.
Dept D86 Albany, Ind.

CP BABCOCK FOUR BOTTLE MILK Tester

PRICE EACH **$6.95**

DON'T KEEP BOARDER COWS

Every dairy man needs this outfit. Points out the "boarder cow". Enables him to buy cows with his eyes open and to check up his creamery, etc. Tells him how to regulate feed to increase production. Highly recommended by U. S. Department of Agriculture, County Agents, etc.

Free with each testing machine: 4 test bottles, 1 acid measure, 1 pipette, 2 brushes, 1 bottle acid and Instruction Sheet giving complete information about testing milk and cream.

Milk Dealers and Dairymen Write for big, free catalogue.

Association Notes

Empire—Osceola, Wisconsin:—Seven herds averaged over 40 lbs. butterfat per cow in May. Two barns were whitewashed. Four cows were sent to the block and two were sold for dairy purposes. Two registered Holsteins were purchased at the Fond du Lac sale. The condensery paid 45 cents per pound for fat and the cheese factory 33 cents. Milk retailed for 12 cents per quart; butter, 30 cents per lb.; cheese 30 cents. Bran cost $30.00 per ton; oats, $24.00; barley, $26.00.

Riverside County Farm Bureau, California:—The reason for such a pronounced decrease in fat production from last month is due to market conditions. The California Milk Producers' Association had set the price on production of February. If a dairyman shipped more than that amount and there was a surplus on the market he would have to take the fat price of 38c. Dairymen did not feel that they could afford to feed grain when it gave them a surplus which they sold at this price. Consequently they are eliminating the concentrates in a good many cases and the result is a decreased production. July 1st sees the adoption of a different scale of prices and this condition should be corrected.

Monticello, Wisconsin:—One pure-bred Holstein bull was purchased to use in a grade herd. Official test work is being encouraged. Several two-year-old records of 15.5 to 19.1 lbs. butter were made in seven days. In May market milk sold for $1.65 per 100 lbs. Milk retailed for 10 cents per quart.

Marshfield—McMillan, Wisconsin:—Local merchants donated $100 in cash for best yearly records made in this association. Free bi-monthly programs of speeches, songs, etc., for farmers are being arranged. There are still four scrub bulls left in the association. The price of milk varied from 77 cents to $1.03 per cwt. in this community. Bran sold for $24.00 per ton; corn, $26.00; oats, 46 cents per bushel.

Jamestown, North Dakota:—Two pure-bred Holstein bulls were purchased in June and several inquiries came from outside the county for calves from the best producing cows. The tester has spent some time helping to fit cattle for the county fair. Market milk sold for $2.00 per cwt. The creamery paid 30 cents per pound for fat.

Coshocton County, Ohio:—Many farmers are feeding about 4 to 6 lbs. of grain to their high test cows. Four unprofitable cows were sold. Market milk sold for $1.80 per 100 lbs. in May. Milk retailed for 12 cents per quart; butter 24 cents per pound.

Kalamazoo, Michigan:—Nearly all feeds are purchased through the farm bureau. All but three herds in the association have been tested for tuberculosis. Several members are planning on buying pure-breds to replace their grades. In May market milk sold for $3.18 per 100 lbs. The creamery paid 32 cents per pound for fat. Milk retailed for 13 cents per quart; butter 36 cents per pound; cheese 28 cents. Alfalfa hay cost $25.00 per ton; clover, $18.00; corn, $36.00; oats, $32.00; cottonseed meal, $40.00; bran, $30.00.

Joe Daviess, No. 2, Illinois:—Three unprofitable cows were sold in June and a number will go to the block this fall. We are trying hard to organize a bull association here. Herds being fed balanced rations are holding up in production much better than those which do not receive grain with pasture. Market milk sold for $1.80 per cwt. The creamery paid 27c per pound for fat and the cheese factory, 25c. Milk retailed at 10c per pound; butter, 32c per pound; cheese, 30c. Alfalfa cost $24 per ton; clover, $24; oats, $1.60 per bushel; corn, $1.70; bran, $1.10 per cwt.; oil meal, $2.50; cottonseed meal, $2.30.

St. Louis—St. Charles County, Missouri:—John L. Boland purchased the top cow at the Missouri State Holstein Sale, a three-year-old that produced over one ton of milk in May. Four cows are on official test. Eight pure-bred Holstein heifers and one bull calf were purchased in Wisconsin. One more milking machine is being operated. In June milk sold for $2.40 per 100 pounds. The creamery paid 24c per pound for fat. Milk retailed for 14c per quart; butter, 35c per pound. Crushed oats cost $34 per ton; cottonseed meal, $36; wheat bran, $25; beet pulp, $38; alfalfa, $25 to $30.

Delaware County, Iowa:—Three unprofitable cows were sold in June. Market milk sold for $2 per 100 pounds. The creamery paid its patrons 32c to 40c per pound for fat. Milk retailed for 10c per quart.

Blue Earth County, Minnesota:—The intense heat and flies are problems to contend with these days in keeping up the milk flow. In June market milk sold for $2.10 per 100 pounds. The creamery paid 33c per pound for fat. Milk retailed for 10c per quart; butter 40c per pound, and cheese, 30c. Feed prices: Bran, $1.25 per cwt.; linseed meal, $2.60; oats, 30c per bushel; corn, 40c; silage, $6 per ton.

Lake County, Illinois:—Several barns were whitewashed. Two milk coolers and two cooling tanks were installed during the month. Several members bought feeds for future delivery through dealers, others are co-operating with neighbors in ordering feed for winter use.

A Year's Report

The North Branch, Pennsylvania, Association completed its year's work June 15. The association reorganized and already the new year is well under way. Following is a summary of the 1920—21 work: Number cows tested, 228.9; pounds milk per cow, 6,445.9; pounds fat per cow, 241.04; feed cost of 100 lbs. milk, $2.05; feed cost of 1 pound fat, $.55; returns for $1 of feed, $1.93; cows producing over 500 lbs. fat, 1; cows producing over 400 pounds fat, 7; cows producing over 300 lbs. fat, 36; cows producing over 12,000 lbs. milk, 5; cows producing over 10,000 lbs. milk, 18; number cows not paying for feed, 22.

The high producing herd for the year is owned by J. E. Lenker; 164 cows averaged 10,613.99 lbs. milk and 360.48 lbs. fat. This herd is composed entirely of pure-bred Holsteins and has made several creditable A. R. records during the year. The average cow of the herd has increased in production 2,000 lbs. milk per year over last year's record.

Nine members of the association have completed two years of work. Their records showed an increase of 633 lbs. milk and 15.4 lbs. fat per cow. Considering local dairying we look on this as being good, constructive improvement. F. J. Holt.

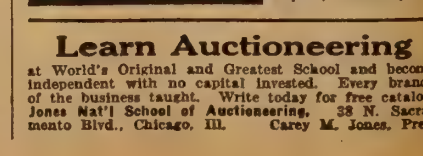
"A Good Trio"

Belmont County, Ohio, premier Jersey county of the state, has a trio of good cow testing associations. This is due to the fact that progressive farmers make up the three associations and because each has an official tester on the job who is not afraid of work and who has lots of pep. The Barnesville Association needs no introduction. Clyde F. Lewis is the detective on the job there. Dan Harpley is testing for the Ohio Valley Cow Testing Association, which was organized last November. C. G. Henry is testing for the Tri-County Cow Testing Association which is on its second year of work.

During the month of May, 740 cows were on test in the three associations, 217 of which made over 40 pounds butterfat, 60 of which made over 50 pounds fat and 20 which made over 60 pounds fat. In the Tri-County Association, W. G. McClain's herd of Holsteins averaged 1,474 pounds milk, 48.37 pounds butterfat; in the Barnesville Association, where the average for all the herds was 348.13 lbs. fat for the past year, J. T. McCartney's herd of Holsteins averaged 43.68 pounds butterfat; and in the Ohio Valley Association Geo. Sumption's herd of pure-bred Jerseys averaged 46½ pounds fat.

The Ohio Valley Association, having completed six months' work successfully, recently held a meeting at Geo. Sumption's and inspected his dairy equipment and his herd. It was found that Mr. Sumption's bull has been increasing the production of his daughters at the rate of 5 pounds butterfat per month over their dams. Professor Erf, of the Ohio State University, and L. P. Bailey talked to the dairymen. About 60 people were present.—J. C. Neff, County Agent, Ohio.

Convenience, beauty, comfort are all qualities which the farm home should have.



Dolling Up the Dairy Cow

(Continued from page 987)

very well. When all the creases are removed a medium grade of sand paper may be applied followed by emery cloth or a fine grade of sand paper. The horns will then be ready for the polish. Using a woolen rag, rub the horn with a mixture of sweet oil and pumice stone. Follow this rubbing with sweet oil alone and finally rub vigorously for several minutes with a dry woolen cloth until the desired gloss is secured. Once it is secured but little work need be done on the horns until just before showing when the final touches must be added again.

Before shipping, a complete list of everything needed should be made out. It is better to have too much than too little. Do not crowd the stock in the car and be especially careful that there are no nails or other projections in the walls that might scar up one of your best prospects. Ship soon enough to arrive at the show two or three days ahead of time. This allows time for the cattle to rest and it gives you an opportunity to have them all looking at their best for the big test. In transit they may be fed the same as at home but the ration should be cut in two. Upon arrival at the show feed them lightly, gradually increasing the feed to a full ration. If washing is necessary do it as early as possible to have time to regain the natural oil and glossiness in the hair. The night before showing, the tail should be washed out and done up in a dozen or more small braids to be brushed out the next day just before showing. A liberal supply of salt given the night before will cause an increased thirst and, if water is withheld until a couple of hours before showing, the heavier drinking will result in a considerable increase of barrel and apparent capacity.

The practice of bagging up the cows that are in milk is a very lamentable one but, since all showmen do it, there is no other resort for those who would compete in fast company. The cow is not milked from the day before until the showing is over. If the quarters of her udder are somewhat unbalanced, this gives a chance to make them appear equal by milking sufficient from any one quarter to make it balance with the rest. Thus a nearly perfect udder may be displayed to the judge who has no way of knowing just how bad the udder may have been.

When entering the show ring go with the determination to win. After spending weeks of preliminary fitting one can ill afford to let down at the last. Even though it may seem that you haven't a chance to place, fight to the last ditch, for many a doubter has been surprised by receiving a worthy placing when but little was expected. Always keep your animal at pose because you never can tell when the judge will make his decision. Do not wait to show your animal until the judge comes around to examine it but when he does you must be on the extra alert. When he tries the hide for handling qualities turn the head slightly to that side to loosen up the skin as much as possible.

Above all things, be a good sport. If you seem to have lost unjustly remember that the breaks will swing your way some time and that for every unjust loss, in the long run, you will receive a lucky win. Do not be the fellow who always has better stuff at home. The cash winnings at the shows are surely the bread and butter of the business but the sugar of the game is the thrill you get when you lead out the animal with the blue. If you were ever thrilled at a race meet you will partially know what it is to win in the show ring against hot competition, and yet the just pride and glory that you have in owning and showing well fitted cattle that can win is only secondary to the practical value gained from the show ring as an advertising and selling medium for good cattle.

BIG CUT IN
International Motor Truck
PRICES

These prices on **International Motor Trucks** are made for the buyer who has been waiting for lowest prices, yet would not be satisfied with anything short of highest quality. For general farm hauling you cannot beat International economy.

Compared price for price, quality for quality, the International line stands today the lowest-priced line of motor trucks on the market, backed by an inspection and service organization without equal.

Remarkable Record Made by Kerry Cow

HOARD'S DAIRYMAN:—The little Kerry cow, Cort Curley 4th, owned by S. J. Brown of County Kildare, Ireland, has recently made what is believed to be a world's record for an animal of her size. In 52 weeks this midget, weighing only 775 lbs,. has produced 10,175 lbs. of milk, or approximately 13 times her own weight.

The Kerry breed, known in Ireland where it was originated as "the poor man's cow", because of its extreme hardiness and easy keeping qualities and its ability to produce well under adverse conditions, is always black in color and of strictly dairy type. The cows range in weight between 500 and 700 lbs.; the bulls about 800 lbs., or about the weight of a Jersey cow. In spite of poor pastures and unfavorable climate in their native land and their small size, the Kerrys are remarkable producers.

The Dexter-Kerry is a somewhat smaller form which shows a marked tendency towards beef type, and usually produces less milk than the true Kerry above mentioned. It may be either solid black or solid red in color.

Neither of these breeds has ever gained popularity in the United States, less than a dozen herds being listed in the herd book of the American Kerry and Dexter Cattle Club, Columbus, Ohio.

Wisconsin. JOE ALEXANDER.

Jersey Cattle Notes

For week ending June 24:

Number of animals registered: Bulls, 214; cows, 561; total, 775. Number of transfers recorded: Bulls, 168; cows, 476; total, 644.

A NEW BOOK for Dairymen

"Concrete on the Dairy Farm"

It will help you boost dairy profits. It's full of valuable information on how and why to use concrete for barns, icehouses, watering troughs, silos, water storage tanks, barnyard pavements—every necessary dairy farm building. Write our nearest District Office for your free copy. Remember!

"Here's Real Tobacco"
says the Good Judge

That gives a man more genuine chewing satisfaction than he ever got out of the ordinary kind.

Smaller chew, lasts longer—so it costs less to chew this class of tobacco.

And the good, rich tobacco taste gives a world of satisfaction.

Any man who uses the Real Tobacco Chew will tell you that.

Put up in two styles

W-B CUT is a long fine-cut tobacco
RIGHT CUT is a short-cut tobacco

Weyman-Bruton Company, 1107 Broadway, New York City

DAIRY MARKET NEWS

Good Demand Supports Cheese

(Report by U. S. Bureau of Markets)

Consumptive demand has been fairly active and buying for storage is still a factor, but there have been no new developments in cheese markets during the week ending July 2. At primary markets in Wisconsin the volume of business was perhaps as good as might be expected during the extreme hot weather, although there was apparently a slight falling off in sales.

Dealers who are particular about inspection have held their prices firmly on best grades, but these prices have found business rather dull. Wisconsin cheese board prices showed slight advances on June 27, but sales later in the week were on practically the same basis as the previous week.

Conservative Storage Buying

The tone in wholesale distributing markets was firm. Buying for immediate trade requirements was active, some storing took place, and at times speculative demand was brisk, notably at Chicago. In general, dealers appeared to have confidence in the situation, although it may be said that most of the storing is being done on the basis of actual needs for fall and winter.

Holdings in the four markets were increased only about 1,000,000 lbs. but it is reported that rather an active into-storage movement is taking place at country points, partly on account of better rates.

The average wholesale prices on American cheese (style Twins) for the week ending July 2, 1921, and for the corresponding week a year ago were as follows:

	Week ending July 2 1921	1920
	Cts.	Cts.
New York	15.9	27.0
Chicago	14.7	25.6
Boston	16.5	27.9
San Francisco	16.9	29.7
Wisconsin	13.2	25.2

The receipts of cheese at these markets were 4,369,610 lbs. as compared with 4,297,146 lbs. a year ago and 5,246,141 lbs. a week ago.

Butter Sales Continue Active

(Report by U. S. Bureau of Markets)

Butter prices again reached higher levels during the week ending July 2, and the markets were mostly firm and active, although a certain amount of skepticism still existed, especially among western buyers. Others who had thought well of the markets so far, began to operate with caution, but the actual conditions of supply and demand as found on the market seemed to warrant the advances made.

Receipts for the week showed a falling off, quality was poorer on the average, and buying for consumption and storage, as well as speculative demand, was active. Undergrades also continued to find a ready outlet which is always a good sign in relation to a market.

Production is apparently on the decline. Eighty-four plants of the American Creamery Butter Manufacturers' Association showed a reduction for the week ending June 25 of 1.4% under the production of the previous week and a decrease of 2.5% as compared with the same week last year. Information at hand points to a greater decrease since then. The arrivals at New York have shown a large percentage of fine quality with medium and undergrades, particularly with butter scoring 90 to 91 points, short of the trade demand. This is probably due to the fact that Chicago has been receiving most of the centralized cars, especially those of fine quality. Most of this butter is finding its way into storage.

Sales of futures for fall delivery have advanced materially, December options closing at 39½c on July 1. Boston reports that most of the storing is being done by dealers who are receiving long lines of contract butter. Local production in that section is light and there has been a strong demand for small lots of western creamery.

The average wholesale prices on 92-score butter at five of the principal markets for the week ending July 2, 1921, and the corresponding week a year ago were as follows:

	Week ending July 2 1921	1920
	Cts.	Cts.
New York	35.4	58.6
Chicago	34.6	56.4
Philadelphia	36.3	58.8
Boston	36.5	59.6
San Francisco	33.5	58.2

The receipts of butter at these markets were 17,288,672 lbs. as compared with 14,957,632 lbs. a year ago and 18,112,640 lbs. a week ago.

New York Butter Market

New York City, July 5:—It is feared that the incentive for higher quality butter production which existed during the greater part of last year has been dispelled because of the unprecedented demand for butter of all grades that has existed in all markets during the past few months. During the greater part of the year, 1920, considerable quantities of Danish butter were being received at irregular intervals in this country. As butter prices were comparatively high at that time, a factor which materially curtailed butter consumption, and as the Danish butter was of vastly superior quality, on the whole, there was little or no demand for butter of inferior quality. As a result there was a wide range in quotations on the various grades of butter and many creameries lost large sums of money because their butter had to be sold for low prices as based on the quotations on fancy butter at that time. However, there is an entirely different condition today. There is a surprising demand for butter of inferior quality and the range of quotations is very narrow. That condition is undoubtedly encouraging creameries which make poor butter and it is very doubtful if they will exert themselves as they did during last year to improve the quality of their butter.

Another factor which, while encouraging to the producer, is of questionable value to the dariy industry as a whole, is the proposed increase of duty on imported butter. The new tariff bill which will soon be up for consideration in Congress carries a tentative duty on butter of 8c, which is an increase of 2c per pound over the duty that is now levied on butter through the operation of the so-called Emergency Tariff Law, which was recently en-

*Hay quotations represent average of cash sales at these markets. †Nominal.

Straw:—The demand for straw has fallen off slightly and prices have declined generally about $1 per ton. The following prices were quoted in the various markets: Wheat straw: Philadelphia $16.50, Pittsburgh $13, Chicago $9, Minneapolis $8, Kansas City $9, Omaha $8. Oat straw is quoted about $1 over wheat straw prices. Rye straw: Philadelphia $24, Pittsburgh $14.50, Chicago $13, Minneapolis $9.

acted. If the proposed tariff becomes operative there is little doubt but that it will exclude all foreign butter from this country. There were many who believed that the Danish butter which arrived last year, while working a temporary hardship on producers and creamery operators, was indirectly of benefit to the dairy industry in that it caused a revival of interest in the improvement of butter quality in this country. It now looks as though the industry would soon be back on the old basis, that is, with the whole energy which is behind it exerted toward quantity rather than quality production.

Receipts have shown a marked decrease during the past two or three weeks and there has been a marked deterioration in quality. Undoubtedly, the hot, dry weather which has prevailed quite generally throughout the country is largely responsible for the decrease but it is also true that New York is receiving less than its usual quota of butter as based on production throughout the country. That is due to the fact that Chicago quotations are on a par with those of New York and freight rates to New York from the dairy sections of the Middle West are much higher than to the western market. Reports from producing sections since the heavy rains of last week indicate a marked increase in production, hence it is anticipated that receipts will increase immediately.

While there has been little change in quotations during the past week, the market has been firm and active at all times and there have been no accumulations of butter in the market. Very little butter is now passing into storage which proves that consumptive demand is accounting for practically all of the current receipts. The price trend is upward at the present time and there is a feeling that there will be a gradual price advance for some time to come. The only price advance during the past week was one of ½c cent today which was the result of the depletion of stocks in jobbers' and retailers' stores over the holiday. Established quotations today are: Higher scoring than extras (93 score or higher), 36½@37c; firsts (90—91 score), 35@35½c; firsts (88—89 score), 33½@34½c; seconds (83—87 score), 30@33c. W. B. Fifteen Cows Average 20 Quarts of Milk a Day

Fifteen Jersey cows on official year's test have made the remarkable average of 60.68 lbs. fat in one month, an average of two pounds of fat per day for each cow. Seven of them were over eight months in milk and only three out of the fifteen were less than two months in their period of lactation.

The average milk production for these animals is 1,205 lbs. of milk for the month, or forty pounds per day, which roughly figures 20 quarts of milk testing over 5% of butterfat. No other herd of this size on record has as yet accomplished such a feat, and in this case it is attributed to the fact that nine of these cows are by the same sire, Holger, one of the most noted bulls of the Jersey breed. Nine of his daughters in the fifteen averaged 1,406.6 lbs. of milk and 69.03 lbs. of butterfat, seven of them qualifying for the 50-lb. list. This record herd of cattle is owned by McArthur and Stauff of Oregon.

Uncle Ab says: City life may have its good points but the folks there have no monopoly on happiness.

Aunt Ada's axioms: Community houses are all right, but the best community center is a happy family.

A Farm Bureau Program

Counties which have organized a farm bureau are interested in the development of a program which will be of interest and value to its members. It is not an easy matter to outline a series of projects in all counties which will be satisfactory to most members and that will render a service which they may expect from their organizations.

The Walworth County Farm Bureau of Wisconsin has a program for 1921 which we publish herewith, not that we expect other counties to adopt it entirely but that they may use such portions of it together with other plans they may desire to follow. The Farm Bureau program of Walworth County is at least suggestive to other counties of what can be done by county farm bureaus.

1. Legislative work.
   - A. Fight modified milk
   - B. Work to secure favorable state legislation
   - C. Protect members from unfair legislation
   - D. Co-operate with state and national offices in their program
   - E. Investigate milk preservatives.
2. Social work.
   - A. Co-operate with farmers' clubs in arranging programs
   - B. Endeavor to get farm bureau picnic
3. Educational work.
   - A. Co-operate with county agent in:
     1. Promoting cow testing associations
     1. Placing labor on farms
     3. All other activities
     4. Soil testing
   - B. Carry on advertising campaign for greater use of dairy products
   - C. Publish facts on farmer's work
     1. Show cost of production
     2. Explain profit making methods
   - D. Discourage use of stock foods
4. Financial work.
   - A. Investigate questionable stock and security issues
   - B. Investigate agencies operating in county
   - C. Back Milk Producers' Association in efforts to get fair price for milk
   - D. Give help in laying out drainage systems
   - E. Publish market facts weekly
   - F. Assist members to buy in large lots through dealer
   - G. Work for lower threshing rates in 1921
   - H. Help buy and sell products for members.
5. Co-operation.
   - A. Form co-operative live stock shipping associations
   - B. Work to market Walworth County butter co-operatively
   - C. Co-operate with other county units in
     1. Ordering coal
     2. Protecting sugar beet growers
     3. Promoting interests of pea growers
   - D. Co-operate with breed associations in promoting sales and clubs.

Jerseys Over 50 Pounds Fat

A recent semi-official test on Waikiki Farm, owned by J. P. Graves of Washington, credited 15 Jerseys with a butterfat production for the month in excess of 50 lbs. The high cow in the herd was G. T. Morocco Duchess, whose production was 1,420.1 lbs. milk and 91.74 lbs. fat. The highest milk production for the month was made by Imperial Greba Pogis, which stood second in fat production, her monthly showing being 1,934.5 lbs. milk containing 77.57 lbs. fat.

Barron Co. Holstein Sale

Barron County Holstein breeders held a successful sale at Chetek, Wis., June 22, selling 41 animals for $6,075. This was not a high average, but it was a fair one considering the class of cattle sold.

Wm. Meisegeier received the top price of the sale, $350 for a 24-lb., 5-year-old granddaughter of Canary Paul.

F. H. Everson was in the box with R. E. Haeger doing the selling. County Agent W. A. Duffy was in charge of all local arrangements.

Formerly Known as "Kil-Zem."

FLY-KIL

Insect Killer and Repellent.

Don't Be Pestered with Flies!

FLY-KIL acts instantly. When applied with a fine fog sprayer it positively kills flies, fleas, lice, ticks, mosquitoes, bed bugs, cock roaches, and many other insect pests.

Fly-Kil protects all stock in barn or field from flies and other insect pests. It is non-inflammable: will not stain, mat the hair nor blister. Pleasant odor—will not taint milk. Prevents development of larvae when sprayed about farm buildings and stagnant water.

Fly-Kil has been proven superior to any other fly spray by many of the largest dairy farmers in Wisconsin and Minnesota. Approved by hundreds of herdsmen, and by Dairy Departments of State Experiment Stations.

Cows protected by Fly-Kil give more milk—young stock fattens more rapidly. Horses work better. Ask your neighbor—perhaps he uses it.

Fifteen gallons will protect 15 cows for the season.

Sold direct to dairymen and other users in the following wholesale quantities, at prices named, f. o. b. Saint Paul (mention whether by express or freight):

In Barrels, (50 gallon steel drum included).....$1.30 per gal.
In Half Barrels, (30 gallon steel drum included)..... 1.35 per gal.
In Quarter Barrels, (15 gallon steel drum included)..... 1.40 per gal.
SPECIAL—2 gallon can (sample order)..... 1.50 per gal.

SEND NO MONEY—All shipments C. O. D.

Our Fly-Kil booklet tells how to keep flies off your stock. Write for it—it's FREE.

Guaranteed to Do All We Claim for It

FREE!

To induce prompt ordering we will give absolutely FREE, a heavy one-gallon galvanized air pressure sprayer with your first order for 15 gallons or more. Order today and get the benefit of this FREE offer.

After using one-fourth of the contents of any container in accordance with directions, any purchaser of Fly-Kil who does not find it superior to any fly spray he has ever used, as a fly killer and repellent, is authorized to return the balance to us for refund of total purchase price of the full container. That's fair—isn't it?

HOARDS DAIRYMAN JUNIORS

A DEPARTMENT FOR THE DAIRY FARM BOY

SENTIMENTS OF THE PAST

In School Days

Still sits the schoolhouse by the road,
A ragged beggar sunning;
Around it still the sumachs grow,
And blackberry vines are running.

Within, the master's desk is seen,
Deep scarred by raps official;
The warping floor, the battered seats,
The jack-knife's carved initial.

The charcoal frescoes on its walls;
The door's worn sill, betraying
The feet that, creeping slow to school,
Went storming out to playing!

Long years ago a winter sun
Shone over it at setting;
Lit up its western window panes,
And low eaves' icy fretting.

It touched the tangled golden curls,
And brown eyes full of grieving,
Of one who still her steps delayed
When all the school were leaving.

For near her stood the little boy
Her childish favor singled;
His cap pulled low upon a face
Where pride and shame were mingled.

Pushing with restless feet the snow
To right and left, he lingered;—
As restlessly her tiny hands
The blue-checked apron fingered.

He saw her lift her eyes; he felt
The soft hand's light caressing,
And heard the tremble of her voice,
As if a fault confessing.

"I'm sorry that I spelt the word;
I hate to go above you,
Because"—the brown eyes lower fell—
"Because, you see, I love you!"

Still memory to a gray haired man
That sweet child face is showing.
Dear girl! The grasses on her grave
Have forty years been growing!

He lives to learn, in life's hard school,
How few who pass above him
Lament their triumph and his loss,
Like her—because they love him.

John G. Whittier.

The Mowers

Where mountains round a lonely dale
Our cottage roof enclose,
Come night or morn, the hissing pail
With yellow cream o'erflows;
And roused at break of day from sleep,
And cheerily trudging hither—
A scythe sweep, and a scythe sweep,
We mow the grass together.

The fog drawn up the mountain side
And scattered flake by flake,
The chasm of blue above grows wide,
And richer blue the lake;
Gay sunlights o'er the hillocks creep,
And join for golden weather—
A scythe sweep, and a scythe sweep,
We mow the dale together.

The good wife stirs at five, we know
The master soon comes round,
And many swaths must lie a-row
Ere breakfast horn shall sound;
The clover and the fiorin deep,
The grass of silver feather—
A scythe sweep, and a scythe sweep,
We mow the dale together.

The noontide brings its welcome rest
Our toil wet brows to dry;
Anew with merry stave and jest
The shrieking hone we ply.
White falls the brook from steep to steep
Among the purple heather—
A scythe sweep, and a scythe sweep,
We mow the dale together.

For dial, see, our shadows turn;
Low lies the stately mead;
A scythe, an hour glass, and an urn—
All flesh is grass, we read.
Tomorrow's sky may laugh or weep,
To Heaven we leave it, whether
A scythe sweep, and a scythe sweep,
We've done our task together.

William Allingham.

WHERE THE CUP OF CONTENTMENT RUNS O'ER

When the Cows Come Home

I love the beautiful evening
When the sunset clouds are gold;
When the barn fowls seek a shelter
And the young lambs seek their fold;
When the four-o'clocks are open,
And the swallows homeward come;
When the horses cease their labors,
And the cows come home.

When the supper's almost ready,
And Johnny is asleep,
And I beside the cradle
My pleasant vigil keep;
Sitting beside the window
Watching for "pa" to come,
While the soft bells gently tinkle
As the cows come home.

When the sunset and the twilight
In mingling hues are bent,
I can sit and watch the shadows
With my full heart all content;
And I wish for nothing brighter,
And I long no more to roam
When the twilight's peace comes o'er me,
And the cows come home.

I see their shadows lengthen
As they slowly cross the field,
And I know the food is wholesome
Which their generous udders yield.
More than the tropic's fruitage,
Than the marble hall or dome,
Are the blessings that surround me
When the cows come home.

Mary E. Nealy.

The Old Rail Fence

The old rail fence with aimless angles
Curved round the scented fields of old;
And wild, blown vines in quaintest tangles
Bloomed there in purple and in gold.
And winds went over cool and sweet,
With rivery ripples in the wheat.

The white road to the river knew it—
The river running wild and fleet;
A cabin path went winding to it,
With light prints of a boy's bare feet,
And cattle in the woods at morn
Roamed by and nipped the bending corn.

In corners cool the plowman rested
When rang the welcome bells of noon;
And there the thrush and partridge nested
And sang the mocking birds of June.
And winds were sweet with muscadines,
And blooms were on the melon vines.

There twlight paused in rosy dreaming,
And o'er the riot of the rills
When starlight on the world was streaming
Rose the love song of whippoorwills,
And with the music and the stars
Love met his sweetheart at the bars.

There, with the evening shadows falling,
In cabin door a woman stands;
And far and sweet her voice is calling,
And children heed her beckoning hands.
There, for the weary ones that roam,
Twinkle the dreamy lights of home.

The corn still waves and vines are clinging;
The larks are hid in bending grain;
The birds sing, as my heart is singing,
Where, lonely in the woodland rain,
The old rail fence—its service o'er—
Curves round the blossoming fields no more.

Yet there I halt my horse, and sighing,
Above the old rail fence I lean.
The snow's upon life's pathway lying
Have left one living glimpse of green!
And still, through change of time and art,
The old rail fence runs round my heart.

Frank L. Stanton.

Farm Yard Song

Over the hill the farm boy goes,
His shadow lengthens along the land,
A giant staff in a giant hand;
In a poplar-tree, above the spring,
The katy-did begins to sing;
The early dews are falling;
Into the stone-heap darts the mink;
The swallow skims the river's brink;
And home to the woodland fly the crows,
When over the hill the farm-boy goes,
Cheerily calling—
"Co', boss! co', boss! co' co'! co'!"
Farther, farther over the hill,
Faintly calling, calling still—
"Co', boss! co', boss! co'! co'! co'!"

Into the yard the farmer goes,
With grateful heart at the close of day;
Harness and chain are hung away;
In the wagon shed stand yoke and plow;
The straw's in the stack, the hay in the mow,
The cooling dews are falling;
The friendly sheep his welome bleat,
The pigs come grunting to his feet,
The whinnying mare her master knows,
When into the yard the farmer goes,
His cattle calling—
"Co', boss! co', boss! co' co'! co'!"
While still the cow-boy, far away,
Goes seeking those that have gone astray—
"Co', boss! co', boss! co' co'! co'!"

Now to her task the milkmaid goes.
The cattle come crowding through the gate,
Lowing, pushing, little and great;
About by the trough, by the barn-yard pump,
The frolicsome yearlings frisk and jump,
While the pleasant dews are falling;
The new milch heifer is quick and shy,
But the old cow waits with tranquil eye;
And the white stream into the bright pail flows,
When to her task the milkmaid goes,
Soothingly calling—
"So, boss! so, boss! so! so! so!"
The cheerful milkmaid takes her stool,
And sits and milks in the twilight cool,
Saying, "So! so, boss! so! so!"

To supper at last the farmer goes.
The apples are pared, the paper read,
The stories are told, then all to bed.
Without, the crickets' ceaseless song
Makes shrill the silence all night long;
The heavy dews are falling.
The housewife's hand has turned the lock;
Drowsily ticks the kitchen clock;
The household sinks to deep repose;
But still in sleep the farm boy goes
Singing, calling—
"Co', boss! co', boss! co' co'! co'!"
And oft the milkmaid in her dreams,
Drums in the pail with flashing streams,
Murmuring, "So, boss, so!"

John T. Trowbridge.

The Old Farm Gate

The old farm-gate hangs sagging down
On rusty hinges, bent and brown;
Its latch is gone, and here and there
It shows rude traces of repair.

The old farm-gate has seen each year
The blossoms bloom and disappear;
The bright green leaves of spring unfold,
And turn to autumn's red and gold.

The children have upon it clung,
And in and out with rapture swung,
When their young hearts were good and pure—
When hope was fair and faith was sure.

Beside that gate have lovers true
Told the old story always new;
Have made their vows, have dreamed of bliss,
And sealed each promise with a kiss.

The old farm-gate has opened wide
To welcome home the new made bride,
When lilacs bloomed, and locusts fair
With their sweet fragrance filled the air.

The gate with rusty weight and chain,
Has closed upon the solemn train
That bore her lifeless form away
Upon a dreary autumn day.

The lichens gray and mosses green
Upon its rotting posts are seen;
Initials carved with youthful skill
Long years ago are on it still.

Yet dear to me above all things,
By reason of the thought it brings,
In that old gate, now sagging down
On rusty hinges, bent and brown.

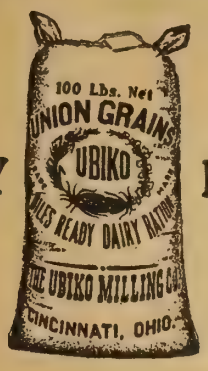
Eugene J. Hall.

Junior Composes Rhyme

HOARD'S DAIRYMAN JUNIORS:—My cow calved April 3rd and I named the calf Cupid. I am quite busy these days, for I am feeding 22 calves before breakfast and after supper each day. Twelve of them are on skimmilk. I am sending you a rhyme which I made while I was feeding them. It is like the Charge of the Light Brigade, but it is on quite a different subject.

Rhyme of the Calf Brigade

Dozen feet, dozen feet,
Here's where we need 'er;
Into the long alley
Marched the calf feeder.
Forward the Calf Brigade,
Charge for the milk, Pa said.
Into the long feed alley
Marched the calf feeder.



Forward the Calf Brigade!
Is there a calf dismayed?
No, for our Holsteins knew
No one has blundered:
Theirs not to make reply,
Theirs not to reason why.
Theirs but to drink or die.
Into the long feed alley
Marched the calf feeder.

Jerry to right of me,
Nigger to left of me,
Bob all over me
Stamped and bellowed;
Stormed at with tongue and tail
Boldly they drink and well
Into the pails of milk,
Into the glorious milk
Went twenty odd noses.

Flashed their pink tongues bare,
Flashed as they turn in air,
Licking the feeder there,
While all the cows wondered.

Canada. GRACE BROWN.

Cow Waters Herself

with this wondertul new Libbey Automatic Water Bowl. Anima. moves lever, opening water valve, when it starts to drink. Lever swings back, closing valve, when animal stops drinking.

15% More Milk

Milk is 87% water, and cows cannot give their greatest yield unless they have plenty of water constantly within reach. Farmers who use Libbey Bowls report an increase of 15% to 20%, which soon pays for the bowls.

Libbey Automatic Water Bowls

are the most sanitary and successful ever invented. Each bowl controls its own water supply, operated entirely by cow, and may be put at different heights, or in any stall or pen. No float tank required. Cannot overflow; cannot get out of order. Almost no water left in bowl to become stagnant. They save labor and feed and increase milk. Prevent spread of contagious diseases, as each cow has her own bowl and no water can pass from one to another, as with old-style bowls. Very simple and easy to install. Write for circular and prices, also FREE DAILY MILK AND FEED RECORD.

If interested in Stanchions, Stalls, Carriers, etc., ask for free General Catalog.

A Missouri Better Bull Tour

HOARD'S DAIRYMAN:—That a great dairy development is at hand in South Missouri is the belief of extension specialists, practical farmers, and others who accompanied the live stock demonstration party of the Missouri College of Agriculture on its recent trip through South Missouri.

Starting on May 2, the party visited 30 counties, practically all in the Ozark region, returning home on June 18. Between 18,000 and 20,000 persons heard the dairy and beef cattle lectures at the 42 shops and 71 separate meetings held. Co-operating with the extension department of the college were four railroads, which carried a car of cattle free over their lines, various breed associations, farm bureaus, county agents, business men, chambers of commerce, and the state board of agriculture. The dairy cattle included Jerseys and Holsteins from the herds of the Missouri College of Agriculture, a Jersey cow from Longview Farm, and Campus Chief Bis, the six-time champion Holstein cow owned by Glenn Davis.

Incidentally, this great cow was much admired throughout the trip and the sight of her brought constant reminders of the time the college toured the state with the renowned Missouri Chief Josephine, grandam of the Davis cow. The individually owned cows were sent along with the approval of the Southwest Jersey Cattle Club and the Missouri State Holstein-Friesian Association. The object was to show the farmers of the state good types of these two breeds. The idea of the dairy department of the College of Agriculture was to demonstrate not only good dairy type, but to show how production has been increased and herds improved by the use of the right kind of sire. "Better bulls", both beef and dairy, was the slogan of the demonstrators throughout the trip.

Professor A. C. Ragsdale, dairy specialist, gave the lectures the first few days of the tour. He told of the foundation of the herds by Professor Eckles, now of Minnesota University, and how they had been built up through the use of good dairy bulls.

Among the animals taken along in the special car was one 15-year-old Jersey from the college herd. She has a record of 9,548 pounds of milk and 510 pounds of fat as a 12-year-old. With her were two of her daughters, showing marked increase in milk yield and improvement in type as the result of using the right kind of bull. Without dealing in a technical way with dairy matters, Professor Ragsdale offered a formidable array of convincing facts and figures to show what can be done with ordinary cows, provided the right sort of dairy bull, of whatever breed, is used.

The Holstein herd at the college was started in 1902 with four foundation cows, two of which were culled out as inferior. No new females have been introduced since that time, yet the herd has been built up to where it is one everywhere commanding respect. Something like $17,000 worth of Holsteins have been sold out of the herd and those now on hand are easily worth more than $17,000. The right sort of bull made this possible, and Professor Ragsdale lost no opportunity to impress this fact on his audiences.

How great is the need for carrying the gospel of dairying to the hills of South Missouri may be seen in conditions at Annapolis. Here the only cream separator in the community was one kept as a sample by a dealer in town, and not a pound of dairy products of any kind has ever been shipped from that point. While this is an unusual case, numerous communities were vistied where a few dairy cows would add materially to the income of the farmers of the vicinity.

At Bismark, St. Francois County, about five cans of cream are being shipped out each week. But conditions in this neighborhood are on the road to improvement, for St. Francois County has three Jersey bull clubs owning some well-bred animals. Several thousand persons in this vicinity heard the practical talks given by Professor M. L. Regan, dairy specialist from the Missouri school.

A. J. McDowell, dairyman for the Frisco railroad, joined the party farther on and aided in the demonstrations. McDowell is himself a practical dairyman who has done much to aid in the development of the milk and butter industry in Southwest Missouri.

E. G. Bennett, Missouri State Dairy Commissioner, accompanied the demonstrators part of the way and his plain, common sense talks added much to the value of the demonstrations.

The South Missourians are taking a deep interest in permanent pastures and are constantly planning to improve their pastures. Probably no one who spoke on the entire trip was given closer attention than W. D. McKee, lecturer for the State Board of Agriculture, who talked on permanent pastures. At every town he was invited by farmers to go out and look at their pastures and make suggestions as to how they could best be handled and improved.

"South Missouri is displaying a most gratifying interest in dairying and better dairy stock," said E. M. Harmon, dairy extension specialist of the Missouri College of Agriculture, who had charge of the dairy demonstrations the last part of the tour. Harmon formerly was county agent in one of the southern counties of Missouri and has taken an active part in dairy matters over the state.

"Without exception we had at least one request for a pure-bred dairy bull at every town where we stopped," Harmon said. "E. J. Alexander, of the Missouri Holstein Association, was along with the party and got orders for a fine lot of Holsteins. A considerable number of other farmers of course wanted Jerseys. These farmers want to get good calves and raise them at home, instead of high priced bulls ready for service, as was the case two and three years ago. We are placing three good dairy bulls now, to where we placed one a year ago."

Professor Harmon believes the Ozark section will eventually be one of the great dairy regions of the country. In support of this contention he points out the relative cheapness of the land, the abundant water, good grass, long outdoor seasons and nearness to big markets, while the need of expensive buildings for winter use is practically non-existent in that section.

"This trip, in effect, took the college of agriculture on cars right out to the farmers who put up the money to support it," said P. H. Ross, extension assistant at the college. "We had just the material we wanted to illustrate our talks, and a whole day was spent in each place, so the farmers had a good chance to look over the stock and discuss things fully with our specialists. I feel that it is the best extension school work the college has ever done and I believe it convinced thousands of farmers who had not before given careful thought to herd improvement through breeding and feeding."

Judging Program at National Dairy Show

Saturday, October 8th, will be opening day of this great show. The Boys' and Girls' Cattle Judging Contest will begin at 9:00 a. m. and consume probably the entire day. Boys entered in this contest will camp in comfortable buildings on the Fair Grounds, and the girls will be housed in dormitories of the Minnesota Agricultural College, adjoining the Fair Grounds.

On Monday, October 10th, at 9:00 a. m., the Agricultural College Students' Judging Contests will begin. The cattle judging contest will be held in the Hippodrome ring and the dairy products judging contest will be held in a cold storage warehouse down town.

Ayrshires will start the regular show judging on Tuesday, October 11th, first classes to be called at 9:00 a. m., Prof. A. C. McCandlish will judge with Mr. A. H. Tryon as associate judge.

Brown Swiss will also show on Tuesday, beginning at 12:00 noon with Prof. G. C. Humphrey as judge and Mr. J. P. Allyn as associate judge.

Guernsey Day will be Wednesday, the 12th, and judging of this breed will begin at 9:00 a. m., with Mr. Robert Scoville, President of the American Guernsey Cattle Club, as judge, and Mr. Chas. L. Hill as associate judge. Unfinished classes in Ayrshires will also be judged on Wednesday.

Holstein judging will begin on Wednesday, the 12th, at 1:30 p. m., with Mr. W. S. Moscrip as judge and Prof. J. B. Fitch as associate judge. Holstein Day will be Thursday, the 13th, since the greater number of classes, including the state herd, will be judged then.

The first Jersey classes will be called on Thursday, the 13th, at 1:30 p. m., with Prof. H. H. Kildee as judge and Hon. C. N. McArthur as associate judge. Judging will be resumed at 9:00 a. m. on Friday, which will be Jersey Day.

The state herds of each breed will be judged at the conclusion of the individual and group classes of the breed, thus giving each state an opportunity to select the herd to be shown in this most exciting contest.

Minnesota Dairy Council

Eighty-five per cent of all Minnesota creameries called upon, or a total of 175, are supporting the Minnesota Dairy Council which was organized for the purpose of advertising dairy products, according to a statement made recently at University Farm by W. A. McKerrow, secretary of the organization. Mr. McKerrow believes that at least 500 to 600 of the local creameries will join the council eventually, and that the cheese and milk producers and distributors will also come in on the same basis.

One of the council's first undertakings in Minnesota, says Mr. McKerrow, was to put on a milk campaign in the twin cities and Duluth, which resulted in increased consumption of milk of more than 15 per cent in those two localities. A dairy film portraying the value of various dairy products and dairy foods is now being displayed in moving picture houses of the state and later will be shown in the school. Mr. McKerrow says that a million people or more will be reached in this manner. About 8,000 attractive butter posters and 2,000 "Use More Dairy Products" posters have been distributed. Many of the latter were posted in local creameries and factories for the effect they might have upon farmers who have been selling their dairy products and buying butter substitutes for home use.

The dairy council has also distributed a large number of recipe books for dairy dishes, and is now arranging for attractive advertising booths at the coming Minnesota State Fair and the National Dairy Show which will be held in the Twin Cities.

Funds for the council's advertising campaign are provided by the payment by creameries co-operating of one-tenth of one per cent per pound of butter produced. Assessments will be levied proportionately upon producers of cheese and milk who co-operate with the council.—Minnesota College of Agriculture.

Do Cups Pay?

The question foremost in the minds of many dairymen is "Does the installation of drinking cups increase the production of the herd"? There is no question but that they decrease the work of caring for the stock and make it more pleasant for the cows and the farmer.

Many instances of increased production following the installation of drinking cups have come to our attention, the latest of these being a report of Mr. Nander Nelson, tester for the Wausau, Wisconsin, Cow Testing Association. In the herd of eight cows owned by Mr. M. C. Ewing, he found that following the installation of drinking cups, there was an increased production of 11 per cent. In getting his figures he did not rely upon the usual method of estimating the milk production from the one day test but he totaled the milk sheets which Mr. Ewing had kept of the daily weights of milk produced by each cow. The following table gives the production of each cow in the herd for the month of November when the drinking cups were not in use and also for the month of December after the cups were installed, the computations being made on the basis of a thirty-day month for the purpose of accurate comparison:

Name of cow	November milk, lbs.	December milk, lbs.
Cherry	710	697
Trixy	406	346
Honey	494	475
Buster	771	1063
Rose	572	635
Clara	459	592
Jess	411	479
Pansy	920	977
	4743	5264

Despite the fact that three cows showed a decrease in production and all the cows were advanced in their lactation period, the herd, as a whole, showed a net gain of 522 lbs. or an average daily gain per cow of over 2 pounds. At the time of this test, Mr. Ewing was selling his milk at 10c a quart and the gain in production for the month of December brought him $24.20 additional in his milk check. To this actual money return should properly be added the greater convenience in watering the cows and saving in time and labor. This would seem to be an excellent return on the investment in drinking cups, particularly when it is remembered that this increase may be reasonably expected to be maintained and so bring in larger milk checks each succeeding month.

Recent Guernsey Records

Mixter Belladona is the one hundred and eighty-second cow to make an Advanced Register record at Mixter Farm, Massachusetts. She qualified for sixth place in Class DD with a record of 11,191.6 lbs. milk containing 588.63 lbs. fat. She is the thirty-fifth Advanced Registry daughter of Langwater Demonstrator.

Third place in class EE is now held by Emma of Fond du Lac, a Guernsey cow owned by B. F. Sheridan of Wisconsin. Her production was 11,412.2 lbs. milk containing 613.26 lbs. fat. She is state champion in her class.

Janette of Graham's Dale, a Guernsey owned by W. R. and R. H. Graham, Wisconsin, the second Advanced Registry cow on the farm, has qualified for sixth place in Class FF with a production of 11,069.60 lbs. milk containing 570.02 lbs. fat.

The West Virginia Guernsey, Milford of Bethany, owned by Waddington Farm, is now champion in Class DD. Her record is 13,727.60 lbs. milk, 708.81 lbs. fat. The champion, her sire, her sire's sire, and her dam were all bred at Waddington Farm.

HELENDALE FARM

HERD SIRE—TRICKSEY SAM A. R.

Periodic Ophthalmia

Please tell me if there is a blindness in horses eyes that comes and goes with the moon. I have a fine horse that seems to be affected in the dark of the moon. Last month in the left eye and this month in the right eye. The eye looks milky, clears up, and don't seem to bother him.

Independence, Kans. H. N. R.

The horse is afflicted with periodic or recurrent ophthalmia, popularly called "moon blindness". The latter name no doubt was given to the disease for the reason that attacks usually occur at intervals of a month or more, but the changes of the moon are not in any way the cause, neither is the disease caused by "wolf" teeth, although many believe to the contrary.

Cataract results after repeated attacks and causes blindness of one or both eyes. There is considerable to indicate that germs are the cause and veterinarians are now experimenting with a biologic prepared from the germ supposed to be the causative agent. Results from its use do not thus far allow of definite conclusions as to its effects.

Blindness may be retarded somewhat by slightly darkening the stable in which the horse should be kept apart from others and at time of attack covering the eyes with a soft cloth to be kept constantly wet with a saturated solution of boric acid. A dram of iodide of potash should also be dissolved in the drinking water night and morning for 10 days. A little one per cent yellow oxide of mercury ointment placed in the eye every other day is also helpful.

The agricultural population produces the bravest men, valiant soldiers, and a class of citizens the least given of all to evil designs.—CATO.

BROWN SWISS

BETTY OF LAKE VIEW

Breed Brown Swiss Cattle

They prove their superiority over other breeds when subjected to severe conditions on the farm, by keeping in good flesh and milking the full while other cows grow thin and reduce their yield. You can prove this to your satisfaction.

Do you want a Pontiac in your herd?

PONTIAC STATE HOSPITAL, Pontiac, Mich.

Respectfully Submitted:

Every effort to create new markets for Holsteins is entitled to your prompt, practical and punchful co-operation. On August 8, 1921, I shall offer forty head of THE breed at auction. All bred in the deep purple; all classy individuals; all pail-profit producers along with such high grade, healthy and "typy" individuals as you may consign to this sale. I want to make Victory Farms a market place of International importance to the Breed and must have your generous, practical help NOW. If you have nothing to sell, come and buy. Bring the folks. If you decide to participate as a seller ship tested, "clean," guaranteed stock via Reading System to Victory Farms, Doylestown, Pa. References: Dun, Bradstreets, Middle City Bank, Philadelphia, Pa.; West End Trust Company, Philadelphia, Pa.; Solebury National Bank, New Hope, Pa. Monday, August 8, 1921, is the date. Victory Farms, Doylestown, Pa., is the place. Ship "clean" stock. Come along yourself.

The young bulls are of serviceable age, from A. R. O. dams and offered at farmers' prices.

LILLIBERK FARMS, J. F. Berkheimer, Owner, Homer, Michigan

The one machine makes both fuel and light

COOKING-FUEL and light from a single source—these are available to every country home equipped with the simple Colt Carbide Lighting-and-Cooking Plant.

The fuel produces the hottest flame known for the gas-range, hot-plate or flat-iron. The light is mellow-white, so like sunlight that Nature herself accepts one for the other.

What is it? How does it work?

The simple Colt machine, down cellar or in an outbuilding, mixes crushed stone (carbide) with water automatically and produces fuel and light—that's all there is to it.

No fuss. Nothing to do but put in a little carbide about once a month. The machine does everything. It shuts off of its own accord when not in use. No waste. You can use even the residue, which is simply slaked lime.

Picture your place after sundown—a radiant jewel set in the blackness of rural night; seemingly a bit of transplanted city. Consider the convenience of city fuel for cooking and ironing—the clean, cool kitchen in summer that makes life worth living.

These advantages are yours with a Colt plant. And the cost is trivial in proportion to the manifold benefits.

Jot your name and address on a postcard and hand it to the R. D. man. By return post you will receive full and complete information which will not obligate you in the least to go further into the proposition.

Do that—you'll be glad you did, over and over again.

Waterloo Boy Economy Absolutely Proved

LAST Fall, C. R. Young, County Agent for Dakota County, Nebraska, held a plowing contest, for the benefit of farmers in his community. Sixteen tractors entered the contest. Fuel, oil and operator's time were charged against each tractor outfit in figuring costs.

The economy of the Waterloo Boy was absolutely proved. With its heavy-duty, two-cylinder, low-speed motor built for economical kerosene-burning, it plowed its allotted four and a half acres of heavy Nebraska soil at the extremely low cost of $1.11 per acre. This, remember, was at the time when fuel, oil and labor costs were at the highest.

The Waterloo Boy furnished power at less cost than any other tractor and at about one-half the cost of a number of other tractors.

Why the Waterloo Boy Is the Economical Tractor for Farm Work

The Waterloo Boy is built especially for heavy duty farm work. Its two-cylinder, heavy-duty, long-stroke, large-bore motor of special design, burns kerosene with unusual economy.

Its consumption of lubricating oil is exceptionally small. In the Dakota County test, the Waterloo Boy used only one-half pint of oil in plowing four and a half acres.

The upkeep cost of the Waterloo Boy over a term of years is low because of its simple, sturdy, high quality construction. Another contributing factor to its low repair cost is the low speed (750 R. P. M.) at which the motor develops 12 horsepower at the drawbar and 25 horsepower at the belt.

Its motor is unusually responsive—the automatic governor insures flexible power to meet varying loads. Remember that the Waterloo Boy has ready, always, reserve power above its rating to meet emergencies.

Unusual accessibility to all of its operating parts saves valuable time in making adjustments and in repair work.

The Waterloo Boy is a real farm tractor that will give many years of satisfactory and economical service—investigate it.

THE AUTO-OILED AERMOTOR

A Real Self-Oiling Windmill

Oil an Aermotor once a year and it is always oiled. Every moving part is completely and fully oiled. A constant stream of oil flows on every bearing. The shafts run in oil. The double gears run in oil in a tightly enclosed gear case. Friction and wear are practically eliminated.

A year's supply of oil is sent with every Aermotor

Any windmill which does not have the gears running in oil is only half oiled. A modern windmill, like a modern automobile, must have its gears enclosed and run in oil. Dry gears, exposed to dust, wear rapidly. Dry bearings and dry gears cause friction and loss of power. The Aermotor pumps in the lightest breeze because it is correctly designed and well oiled. To get everlasting windmill satisfaction, buy the Aermotor.
